Sim Mong Cheng, Terence

Contents

- Mean shift algorithm
- Basic feature
 - No occlusion
 - No change
- Further features:
 - Track an object that changes in size.
 - Track an object that is occluded in a number of frames
- Improvements
- References

Overall idea

- Mean shift intuition
 - **Slide credit: Yaron Ukrainitz & Bernard Sarel**

Intuitive Description

Objective : Find the densest region
Distribution of identical billiard balls

Intuitive Description

Objective : Find the densest region

Distribution of identical billiard balls

Color space

- HSV (Hue, Saturation, Value)
- Characteristics
 - Similar to human visual perception of color.
 - Robust with lighting changes.
 - Quantization rate
 - Hue (color): 8
 - Saturation (gray scale): 8
 - Value (color darkness): 4

Basic Level

No occlusion or size change

Basic level

- [Demonstration video](#)

Basic level

- Originally non-negative weights

$$w_i = \sum_{u=1}^m \delta[b(x_i) - u] \sqrt{\frac{\hat{q}_u}{\hat{p}_u(\hat{y}_0)}}$$

- Works well only when
 - The tracked object moves at low speed (background colors rarely dominate target candidate).

Basic level

- Our approach:

Mean shift with **negative weights allowed**.

$$w_i = \sum_{u=1}^m \delta[b(x_i) - u] \log \left(\frac{\hat{q}_u}{\hat{p}_u(\hat{y}_0)} \right)$$

- A point's weight: a vote for the direction of the meanshift offset.

Non-negative weights

$$\sqrt{\frac{\hat{q}_u}{\hat{p}_u(\hat{y}_0)}}$$

Negative weights allowed

$$\log\left(\frac{\hat{q}_u}{\hat{p}_u(\hat{y}_0)}\right)$$

Intermediate Level

1. Change in size

Change in size

- [Demonstration Video](#)

Change in size

- Approach
 - Greedily search for the best match.
 - Vary the radius (which represents width and height)

Intermediate Level

2. Occlusion

Occlusion

- Assumption during occlusion period
 - No huge change in direction and velocity.
 - No change in size.
- Terminology
 - Hypothetical states
 - Position
 - Velocity
 - Bhattacharya coefficient (Rho)
 - The similarity between the hypothetical state and the target model.
 - Mean state
 - Estimated target state
 - Mean of hypothetical states.

Approach

- Initialization
 - N hypothetical states.
 - Probability p_i for each state
 - The more similar, the more probable
- Choose hypothetical states S_t based on its probability
- Update hypothetical states

Approach (Occlusion)

- Occlusion detection
 - Rho of mean shift result is less than a certain threshold (empirically set)
 - Intuition
 - The object is nowhere to be found, i.e. occluded.

Approach (Occlusion)

- Occlusion period
 - Estimate the mean state
- Reoccurrence detection
 - Rho at the mean state is greater than a threshold.
 - Position of target is set to the mean state
 - Switch back to tracking using mean shift.

Occlusion
