CS5219 2010-11 by Abhik

Programming

Creativity + Precision

CS5219 2010-11 by Abhik

Software construction

- From a design model
 - In safety-critical domains – automotive, avionics.
 - D0 I78C – software in airborne systems.
- Or, hand-constructed
 - Usual practice – audio, video and other domains.
 - UML models only for guidance.

CS5219 2010-11 by Abhik

Model-driven engineering

CS5219 2010-11 by Abhik

No model may be available.

CS5219 2010-11 by Abhik

The art of debugging

"A **software bug** (or just "bug") is an error, flaw, mistake, ... in a computer program that prevents it from behaving as intended (e.g., producing an **incorrect result**). ... Reports detailing bugs in a program are commonly known as **bug reports**, fault reports, ... change requests, and so forth."
--- Wikipedia

6

More on the art...

“Even today, debugging remains very much of an art. Much of the computer science community has largely ignored the debugging problem..... over 50 percent of the problems resulted from the time and space chasm between symptom and root cause or inadequate debugging tools.” (Hailpern & Santhanam, IBM Sys Jnl, 41 (1), 2002)

- > Need methods and tools to trace back to the root cause of bug from the manifested error
- > What about the current tools?

7

Tools?

We should **automatically** produce the bug report via analysis of program and/or execution trace

Bug report is a small **fragment** of the program.

8

Organization

- **Dynamic** checking of programs
 - Dynamic slicing
 - Hierarchical slicing
 - Fault Localization

CSS219 2010-11 by Abhik

What is dynamic checking?

- Check program executions, not source code.
- How to generate program executions?
 - Testing (coverage based)
 - Testing (specification based)
- How to check program executions
 - Data and control dependencies (slicing)
 - By comparing against other program executions (fault localization).

CSS219 2010-11 by Abhik

SW Debugging: Social aspects

Software-controlled devices are ubiquitous ---
automotive control, avionics control and consumer electronics
Many of these software are **safety-critical**
=> should be validated extensively.

CSS219 2010-11 by Abhik

SW Debugging: Economics

- How often do bugs appear ?
- How many of them are critical?
- How much money does a company gain by using sophisticated debugging tools?
- Could it be avoided simply by sparing one more programmer?

CSS219 2010-11 by Abhik

SW Debugging: Economics

- SW project with **5 million** LOC (note: Windows Vista is 50 million LOC !!)
- Assume **linear scaling up of errors**
 - Actually could be more errors --- we make more mistakes as the SW grows long and arduous.
- 1 hr to fix each major error**
 - Actually much more
- \$40K salary per year**

$$13 * \frac{5000000}{1000} = 65,000 \text{ bugs}$$

$$\frac{65,000}{44} \text{ weeks} = 1477 \text{ weeks} = \frac{1477}{50} \approx 30 \text{ years} = \$1.2 \text{ M}$$

CS5219 2010-11 by Abhik

SW Debugging: tools

“Even today, debugging remains very much of an art. Much of the computer science community has largely ignored the debugging problem..... over 50 percent of the problems resulted from the time and space chasm between symptom and root cause or inadequate debugging tools.” (Hailpern & Santhanam, IBM Sys Jnl, 41(1), 2002)

- > Need methods and tools to trace back to the root cause of bug from the manifested error
- > What about the current tools?

CS5219 2010-11 by Abhik

jdb on windows XP

CS5219 2010-11 by Abhik

VB watch debugger

CS5219 2010-11 by Abhik

So, what did we see?

- Command line tool for Java
 - User can set breakpoints, and
 - Replay an execution, and
 - Watch it at the breakpoints.
- Lack of GUI is **not** the issue here.
 - Can easily collect and visualize more program info.
- Lack of automation is the problem!
 - Need automated trace analysis.

CS5219 2010-11 by Abhik

Program Slicing

```

1  b=1;
2  y=1;
3  If (a>1){
4      if (b>1){
5          x=2;
6          }
7      }
8  printf ("%d", x);
    
```

CS5219 2010-11 by Abhik

Program Slicing

```

1  b=1;
2  y=1;
3  if (a>1){
4      if (b>1){
5          x=2;
        }
    }
6  printf ("%d", x);
    
```

Control Dependence (green arrows from 3 to 4, 4 to 5, 3 to 6)

Data Dependence (red arrows from 1 to 5, 2 to 5, 5 to 6)

Slicing Criterion: `printf ("%d", x);`

CSS219 2010-11 by Abhik

Program Slicing

```

1  b=2;
2  y=1;
3  if (a>1){
4      if (b>1){
5          x=2;
        }
    }
6  printf ("%d", x);
    
```

Control Dependence (green arrows from 3 to 4, 4 to 5, 3 to 6)

Data Dependence (red arrows from 1 to 5, 2 to 5, 5 to 6)

Slicing Criterion: `printf ("%d", x);`

CSS219 2010-11 by Abhik

Program Dependence Graph

Constructed for the program. Node can be statements or instructions. Edges denote control and data dependencies.

CSS219 2010-11 by Abhik

Program Slicing

CSS219 2010-11 by Abhik

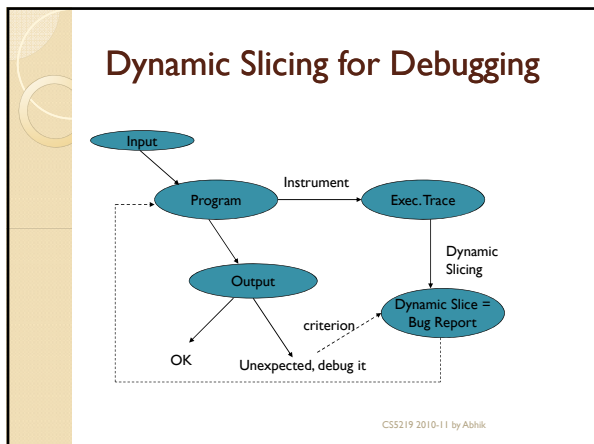

Program Slicing

CSS219 2010-11 by Abhik

Static vs Dynamic Slicing

- Static Slicing
 - source code
 - statement
 - static dependence
- Dynamic Slicing (useful for debugging)
 - a particular execution
 - statement instance
 - dynamic dependence

CSS219 2010-11 by Abhik

- ### Dynamic Slice
- Set slicing criterion
 - (Variable v at first instance of line 70)
 - The value of variable v at first instance of line 70 is unexpected.
 - Dynamic slice
 - Closure of
 - Data dependencies &
 - Control dependencies
 - from the slicing criterion.
- CS5219 2010-11 by Abhik

Dynamic data dependencies

$V := I;$
...
 $U := V$

An edge from a variable usage to the latest definition of the variable.

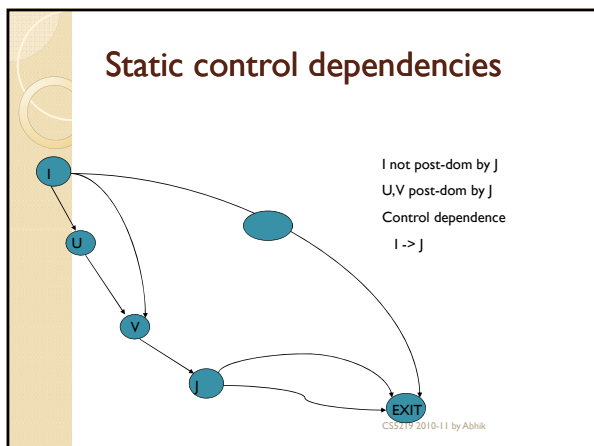

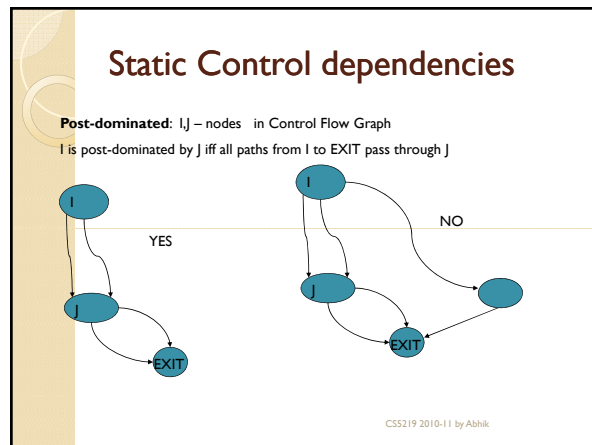

$A[j] := I;$
...
 $U := A[j]$

→ Do we consider this data dependence edge ?

→ Remember that the slicing is for an input, so the addresses are resolved. In the trace, we have the memory addresses instead of the names $A[j], A[j]$.

→ We thus define data dependencies corresponding to memory locations rather than variable names.

CS5219 2010-11 by Abhik

- ### Dynamic control dependencies
- X is dynamically control dependent on Y if
 - Y occurs before X in the execution trace
 - X 's stmt. is statically control dependent on Y 's stmt.
 - No statement Z between Y and X is such that X 's stmt. is statically control dependent on Z 's stmt.
 - Captures the intuition:
 - What is the nearest conditional branch statement that allows X to be executed, in the execution trace under consideration.
- CS5219 2010-11 by Abhik

Dynamic Slice

```

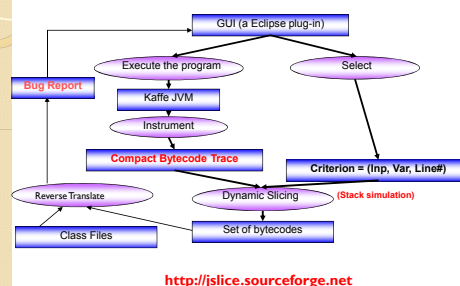

1. void setRunningVersion(boolean runningVersion)
2.   if( runningVersion ){
3.     savedValue = value;
4.   } else{
5.     savedValue = "";
6.   }
7.   this.runningVersion = runningVersion;
8.   System.out.println(savedValue);

```

Slicing Criterion

CS5219 2010-11 by Abhik

Jslice: a dynamic slicing tool

CS5219 2010-11 by Abhik

Issues for such a slicing tool

- Online trace compression – beyond conventional string compression.
 - Full trace is **never** stored.
- Program dependence analysis on compressed trace – no decompression.
- Analysis at low-level (byte-code) to support third-party software.
 - Managing stack architecture.

CS5219 2010-11 by Abhik

Organization

- Dynamic checking of programs
 - Dynamic slicing
 - **Hierarchical slicing**
 - Fault Localization

CS5219 2010-11 by Abhik

Problem with dynamic slicing

- Huge overheads
 - Backwards slicing requires trace storage.
 - Jslice tool for Java
 - Online trace compression & traversal
 - <http://jslice.sourceforge.net>
- Dynamic Slice is still too large ...
 - ... for human comprehension
 - Now

CS5219 2010-11 by Abhik

An example

```

1 public static void main(String[] args) {
2     .....
3     init( db );
4     operate( db );
5     output ( db )
6     return;
7 }

```

*SPECJVM
DB program*

```

init( .. db ) {
  db = ..
  ....
}

```

```

operate ( ... db ) {
  db = ..
  ...
}

```

```

output (db) {
  .....
  print(db...);
}

```

CS5219 2010-11 by Abhik

Divide trace into phases

```

1 public static void main(String[] args) {
2     .....
3     init( db );
4     operate( db );
5     output ( db );
6     return; }
    
```

CS5219 2010-11 by Abhik

Report inter-phase dependencies

Intra-phase control and data dependencies are suppressed.
Inter-phase dep. form input-output relationships.

CS5219 2010-11 by Abhik

Programmer zooms into ...

... one phase by inspecting the phase outputs
-> (may/may not involve re-executing program)

CS5219 2010-11 by Abhik

Parallel Dependence Chains

```

x1 = f1();
x2 = f2();
x3 = f3();
y = x1 + x2 + x3;
print y -- Criterion
    
```

CS5219 2010-11 by Abhik

Hierarchical dynamic slicing

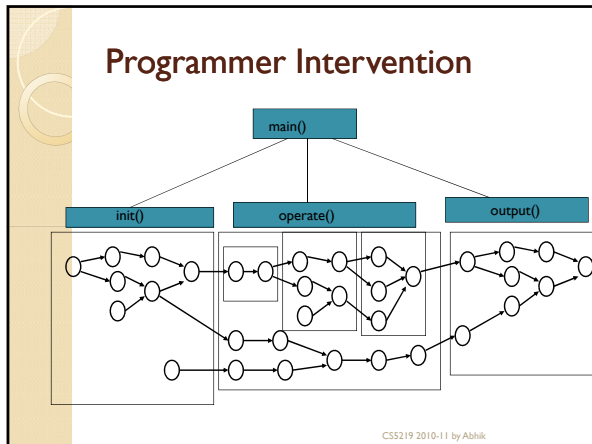

- Compute “phases” of an exec. trace
 - Control structure boundaries
- Augment dynamic slicing algorithm
 - Mark inter-phase dependencies
 - Compute only reachable nodes from selected inter-phase dependency.
- Programmer intervention
 - Select the first suspicious inter-phase dep.
 - **Comprehension guides computation.**

CS5219 2010-11 by Abhik

Phase Detection

- Divide an exec. trace at boundaries of
 - Loops
 - Method calls
 - Loop iterations
 - ...
 - and recursively again at these control structure boundaries.

CS5219 2010-11 by Abhik

- ### So far
- Program Slicing
 - Static Slicing
 - Dynamic Slicing
 - One of the oldest debugging methods around.
 - Hierarchical Dynamic Slicing
 - Tackling the large dynamic slice in real-life programs.
 - Now ...
 - Relevant Slicing (why?)
 - While dynamic slice is large, it may still leave out some statements which are useful for explaining a given observable error.
- CSS219 2010-11 by Abhik

Relevant Slicing

```

1 b=10;
2 x=1;
3 if (a>1){
4   if (b>1){
5     x=2;
6   }
7 }
8 printf ("%d", x);
    
```

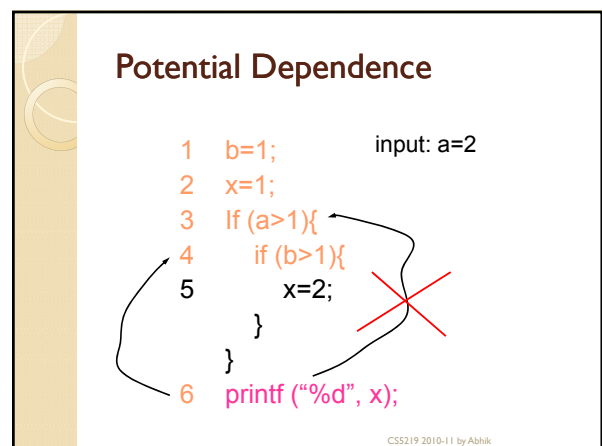

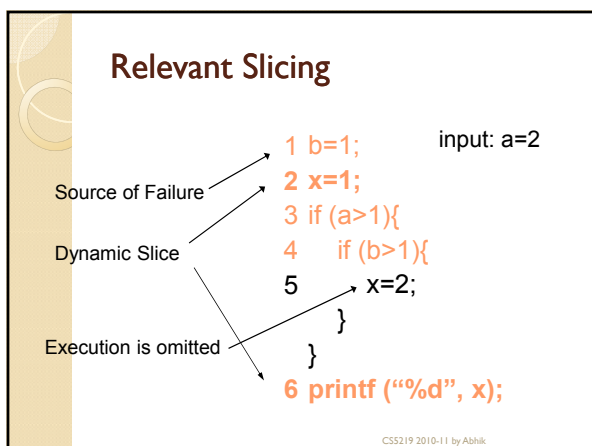

CSS219 2010-11 by Abhik

Relevant Slicing

```

1 b=1;
2 x=1;
3 if (a>1){
4   if (b>1){
5     x=2;
6   }
7 }
8 printf ("%d", x);
    
```

CSS219 2010-11 by Abhik

Relevant Slice

```

1  b=1;
2  x=1;
3  if (a>1){
4      if (b>1){
5          x=2;
6      }
7  }
8  printf("%d", x);
    
```

input: a=2

Potential Dependence (lines 1-2 to 4)

Dynamic Data Dependence (lines 1-2 to 5)

CS5219 2010-11 by Abhik

Program Slice

Static	Dynamic	Relevant	Code
1		1	1 b=1; input: a=2
2	2	2	2 x=1;
3			3 if (a>1){
4		4	4 if (b>1){
5		5	5 x=2;
			6 }
6	6	6	6 printf ("%d", x);

CS5219 2010-11 by Abhik

Program Slicing

CS5219 2010-11 by Abhik

Organization

- Dynamic checking of programs
 - Dynamic slicing
 - Hierarchical slicing
 - **Fault Localization**

CS5219 2010-11 by Abhik

More on debugging

- Dynamic slicing analyzes the problematic execution trace.
 - Problematic: output is unexpected
 - OK: output is as expected.
- Alternatively:
 - We could compare a given problematic trace with an OK trace to localize the source of error.

53

Fault Localization: overview

```

graph TD
    FR([Failing Run]) --> CE[Compare Execution]
    SR([Successful Run]) --> CE
    CE --> D([Difference])
    D --> Dev[Developer]
    D --- BR[As bug report]
    
```

54

Comparing executions

```

1. m=...
2. if (m >= 0) {
3.   ...
4.   lastm = m;
5. }
6. ....
    
```

should be
if ((m >= 0) && (lastm!=m))

55

Comparing executions

```

1. m=...
2. if (m >= 0) {
3.   ...
4.   lastm = m;
5. }
6. ....
    
```

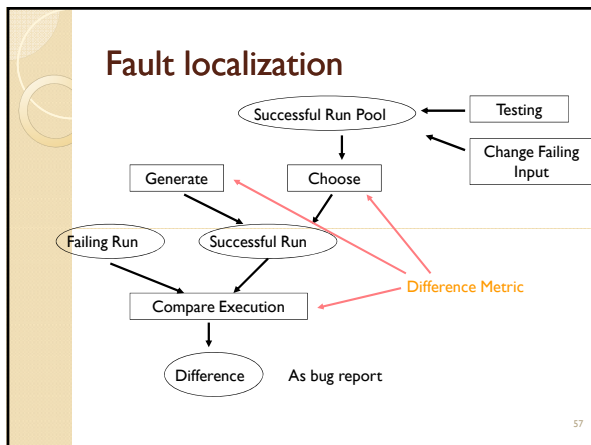

Failing run

```

1. m=...
2. if (m >= 0) {
3.   ...
4.   lastm = m;
5. }
6. ....
    
```

Successful run

56

Example program

```

1. if (a)
2.   i = i + 1;
3. if (b)
4.   j = j + 1;
5. if (c)
6.   if (d)
7.     k = k + 1;
8.   else
9.     k = k + 2;
10. printf("%d", k);
    
```

Program

Copyright (c) 2009, Abhik Roychoudhury 58

Comparing executions

```

1. if (a)
2.   i = i + 1;
3. if (b)
4.   j = j + 1;
5. if (c)
6.   if (d)
7.     k = k + 1;
8.   else
9.     k = k + 2;
10. printf("%d", k);
    
```

Execution run π

```

1. if (a)
2.   i = i + 1;
3. if (b)
4.   j = j + 1;
5. if (c)
6.   if (d)
7.     k = k + 1;
8.   else
9.     k = k + 2;
10. printf("%d", k);
    
```

Execution run πI

59

Set of statements

- S = Set of statements executed in π
 - {1,3,5,6,7,10}
- S_I = Set of statements executed in πI
 - {1,3,4,5,6,9,10}
- If π is faulty and πI is OK
 - Bug report = $S - S_I = \{4,7\}$
- **Choice of the execution run to compare with is very important.**
 - We will see a method in the next lecture to take care of this problem!

60

Do not take "statement sets"

```

while(...){
  if (c1){
    S1;}
  else{
    S2;
  }
  S3;
}
    
```

	<u>Trace 1</u>	<u>Trace 2</u>
	if (c1)	if (c1)
	S1	S2
	S3	S3
	if (c1)	if (c1)
	S2	S1
	S3	S3

Stmts(Trace1)–Stmts(Trace2)= ϕ

CS5219 2010-11 by Abhik

Another difference metric

Failing Run Successful Runs

- Number of Branches
- Location of Branches

Compare

62

Difference b/w traces shown

<ol style="list-style-type: none"> 1. if (a) 2. i = i + 1; 3. if (b) 4. j = j + 1; 5. if (c) 6. if (d) 7. k = k + 1; 8. else 9. k = k + 2; 10. printf("%d", k); 	<ol style="list-style-type: none"> 1. if (a) 2. i = i + 1; 3. if (b) 4. j = j + 1; 5. if (c) 6. if (d) 7. k = k + 1; 8. else 9. k = k + 2; 10. printf("%d", k);
---	---

63

Trace alignment and differences

Execution Run	Alignment				Difference		
π	π'	π''	π	π'	π''	$diff(\pi, \pi')$	$diff(\pi', \pi'')$
1 ¹	1 ¹	1 ¹					
2 ²	1 ¹	2 ²					
3 ³	2 ²	2 ²					
4 ⁴	3 ³	3 ³					
5 ⁵	4 ⁴	4 ⁴					
6 ⁶	5 ⁵	5 ⁵					
7 ⁶	7 ⁴	7 ⁶				•
