Week 5 Saturday session  
CS 3211

Abhik Roychoudhury  
NUS

### 1. Describe as a process

```

    graph LR
      0((0)) -- hello --> 1((1))
      1 -- converse --> 2((2))
      2 -- goodbye --> 3((3))
  
```

hello -> converse -> goodbye -> STOP

STOP is a special pre-defined process which engages in no actions, and does not have any defining process equation

### 2. Describe as a process

```

    graph LR
      0((0)) -- arrive --> 1((1))
      1 -- work --> 2((2))
      2 -- leave --> 0
  
```

$P = \text{arrive} \rightarrow \text{work} \rightarrow \text{leave} \rightarrow P$

A recursive process equation is needed in this case.

### 3. Describe as a process

```

    graph LR
      0((0)) -- weekday --> 1((1))
      1 -- sleep --> 2((2))
      2 -- work --> 1
      1 -- weekend --> 3((3))
      3 -- sleep --> 4((4))
      4 -- shop --> 0
  
```

$P = ( \text{weekday} \rightarrow \text{sleep} \rightarrow \text{work} \rightarrow P$   
 $\quad | \text{weekend} \rightarrow \text{sleep} \rightarrow \text{shop} \rightarrow P$   
 $\quad )$

The choice operator is also needed here.

### 4. Describe a RADIO

- ▶ A FM radio has 3 controls
  - ▶ A on/off switch does the obvious.
  - ▶ When reset is pressed, the radio is tuned to high frequencies
  - ▶ When scan is pressed, the radio is tuned to low frequencies. It stops scanning when it locks to a station or when it reaches the bottom (an end action).
    - ▶ If the radio is currently tuned to a station and scan is pressed – it starts to scan from that station to downwards frequencies.
    - ▶ Similarly for reset, it scans from current station upwards.
- ▶ Write process equation for the RADIO process. The actions should be
  - ▶ {on, off, scan, reset, lock, end}

### Answer:

```

RADIO = OFF,
OFF = (on -> TOP),
TOP = (scan -> SCANNING | reset -> TOP | off -> OFF),
SCANNING = (scan -> SCANNING | reset -> TOP | off -> OFF | lock -> TUNED | end -> BOTTOM),
TUNED = (scan -> SCANNING | reset -> TOP | off -> OFF),
BOTTOM = (scan -> BOTTOM | reset -> TOP | off -> OFF).
  
```

- ▶ Now describe the same behavior via a state machine.

## 5. Model concurrency in a museum

A museum allows visitors to enter through the east entrance and leave through west exit. Arrivals and departures are signaled to the museum controller by the turnstiles at entry/exit.

At opening time, the museum director communicates to the controller that the museum is open, and the controller allows arrivals/departures.

At closing time, the museum director communicates to the controller that the museum is closed, and the controller allows only departures.

Model the above as a concurrent program.

- What will be the processes in such a program.
- Describe the process equation for each process.

## Answer a.

- ▶ The processes are
  - ▶ CONTROL
  - ▶ DIRECTOR
  - ▶ EAST (entry turnstile)
  - ▶ WEST (exit turnstile)

## Answer b.

const N = 100 */\* can put any upper bound here \*/*

EAST = (arrive -> EAST).

WEST = (leave -> WEST).

DIRECTOR = (open -> close -> DIRECTOR).

CONTROL = CLOSED[0].

CLOSED[0..N] = (when (i==0) open -> OPENED[0]  
| when (i>0) leave -> CLOSED[i-1]  
).

OPENED[0..N] = (close -> CLOSED[i]  
| when (i<N) arrive -> OPENED[i+1]  
| when (i>0) leave -> OPENED[i-1]  
).

||MUSEUM = (EAST || WEST || DIRECTOR || CONTROL).

## 6. Recursive locks in Java

- ▶ Recall how we had described a basic lock as a process.
- ▶ Describe the recursive locks in Java, with the restriction that a thread can lock a shared object at most k times, for some  $k \geq 2$ . The actions should be {acquire, release}
- ▶ Now show, the communication of the recursive lock process with a process which tries to acquire the lock k+1 times.

## Answer

$$\text{Klock}(x,k) = ( \text{when } (x < k) \text{ acquire} \rightarrow \text{Klock}(x+1,k) \\ | \text{when } (x > 0) \text{ release} \rightarrow \text{Klock}(x-1,k) \\ ).$$

Acquire and release are shared actions, for the purpose of communicating with processes which acquire/release locks on the shared object in question.

So, the communication is via the shared actions {acquire, release}.

## Coverage of concepts

- ▶ Questions 1, 2, 3
  - ▶ Basics – warm-up
- ▶ Question 4
  - ▶ Question on processes
  - ▶ Reading – chapter 2 of textbook
- ▶ Question 5
  - ▶ Question on concurrent execution
  - ▶ Reading – chapter 3 of textbook
- ▶ Question 6
  - ▶ Question on shared objects
  - ▶ Reading – chapter 4 of textbook

**Disclaimer:** These are not all the representative questions, or an indicator mid-term. These questions are meant for sharpening the concepts.
