イロト イヨト イヨト イヨト

Introduction

What is matchmoving?

- Purpose: To place CG elements in live-action footage as though they are in the real scene.
- Relatively easy if camera in live-action footage is stationary.
- Otherwise, need to match camera motion.
 - Recover camera parameters: calibration.
 - Recover camera motion path: tracking.
 - Reconstruct spatial layout of 3D environment: 3D reconstruction.
- Camera parameters, motion path, 3D coordinate systems are imported to animation software, e.g., Maya.

イロト 不同ト イヨト イヨト

To understand matchmoving, need to understand:

- camera
- calibration
- tracking

Here, we present basic ideas. For details about algorithms, refer to

CS4243 Computer Vision and Pattern Recognition

イロト イポト イヨト イヨト

Camera

Perspective Camera Model

3D object point \mathbf{X}_i is projected to 2D image point \mathbf{x}_i .

• C: camera center, f: focal length, o: principal point.

(CS5245)

< 注→ < 注→

In mathematics, with stationary \mathbf{X}_i ,

$$\mathbf{x}_{i}(t) = \mathbf{K}[\mathbf{R}(t)\mathbf{X}_{i} - \mathbf{R}(t)\mathbf{C}(t)]$$
(1)

where

- $\mathbf{R}(t)$ is camera's orientation in world coordinate frame at time t.
- $\mathbf{C}(t)$ is camera center in world coordinate frame at time t.
- K is camera matrix, contains camera parameters:

$$\mathbf{K} = \begin{bmatrix} \alpha f & s & o_x \\ 0 & f & o_y \\ 0 & 0 & 1 \end{bmatrix}$$
(2)

イロト イヨト イヨト イヨト

• α : aspect ratio, f: focal length, s: skew, o: principal point

Camera

When camera moves, 3D point projects to different 2D image points.

(CS5245)

6 / 29

Camera

In addition, there is lens distortion.

(a) No distortion.

(b) With lense distortion.

・ロト ・回ト ・ヨト

-∢ ≣ ▶

\mathbf{Camera}

2th-order Radial distortion:

$$\mathbf{x}_i' = (1 + \kappa r_i^2) \,\mathbf{x}_i \tag{3}$$

イロト イヨト イヨト イヨト

where

- \mathbf{x}'_i is distorted coordinate
- κ is distortion coefficient

•
$$r_i^2 = x_i^2 + y_i^2$$

- To be more accurate, use higher-order distortion model.
- Can also include tangential distortion model.
- Will discuss about algorithm in Image Morphing lecture.

Recap:

$$\mathbf{x}_{i}(t) = \mathbf{K}[\mathbf{R}(t)\mathbf{X}_{i} - \mathbf{R}(t)\mathbf{C}(t)]$$
(4)

- If corresponding \mathbf{X}_i and $\mathbf{x}_i(t)$ are known, can solve for \mathbf{K} , $\mathbf{R}(t)$, $\mathbf{C}(t)$.
- But, in matchmoving, \mathbf{X}_i are unknown!
- Fortunately, can still compute **K**, $\mathbf{R}(t)$, $\mathbf{C}(t)$ if we know $\mathbf{x}_i(t)$ at different time t, i.e., in different image frames.

Main Ideas:

- Determine $\mathbf{x}_i(t)$ from input images: 2D point tracking.
- Use tracked $\mathbf{x}_i(t)$ to solve for \mathbf{K} , $\mathbf{R}(t)$, $\mathbf{C}(t)$: camera calibration and tracking.
- Finally, can compute \mathbf{X}_i : 3D reconstruction.
- MatchMover Pro can perform all these.

イロト イボト イヨト イヨト 三日

Matchmoving in MatchMover

Steps in Matchmoving

- Import live footage into MatchMover.
- **2** Track 2D points in live footage.
- Solution Calibrate and track camera.
- Oreate 3D coordinate frame.
- Export camera parameters and motion path to 3D animation software, e.g., Maya.

See [1, 3] for details and tutorials.

・ロト ・回ト ・ヨト ・ヨト

Tracking 2D Points

MatchMover uses feature-based tracking algorithm.

- Look for distinct features or patterns to track.
- Example: corners.

Feature-Based Tracking

(a) image at time t (b) image at time t + 1

• Look for distinct features enclosed in pattern zone (dashed box).

Sor each feature,

- Search for feature within search zone (dotted box) in next frame.
- Find best matching location in search zone.
- Solution Repeat for all features in image.

イロト イヨト イヨト イヨト

MatchMover's tracking algorithm is quite sophisticated.

- Can set the size of pattern zone and search zone.
- Can use gray level (faster) or color (slower but more accurate).
- Can predict positions of tracked points.
- With subpixel accuracy, i.e., fractional pixel position.
- Measure tracking quality.
- Can specify starting and ending frames of a track.

イロト 不得下 イヨト イヨト

MatchMover supports two tracking modes:

Automatic Tracking

- Track many points at the same time.
- Use 3D coherency in tracking.
- Select best automatic tracks for camera calibration and tracking.
- Perform camera calibration and tracking automatically.

Supervised Tracking

- User selects the points to track.
- Track one point at a time.
- Cannot use 3D coherency.
- Does not perform camera calibration and tracking automatically.

These two modes can be used in combination.

イロト 不得下 イヨト イヨト

Example: Automatic 2D tracking results.

Tracking quality: green = good, yellow = fair, red = poor.

Reconstructed 3D points: Camera's view.

Demo: lion-3D.avi

< ⊒⇒

Reconstructed 3D points: 3D views.

(CS5245)

Tracking Tips

- Track distinct points such as corners.
- Track points on stationary objects.
- Track true 3D points instead of boundaries between objects.
- Cover 3D space with adequate number of track points.
- Track enough points for accuracy and robustness in camera calibration.
- Tracking results don't have to be perfect. Just need to be good enough for good matchmoving.

イロト 不得下 イヨト イヨト

If scene is too homogeneous, create features for tracking.

Example: Magic Glove (2005).

Demo: Magic Glove - makingof.mpg

(CS5245)

< 口 > < 同

э

Matchmove Examples

Automatic 2D tracking results with track cleaning:

- Average 30 best tracks per frame.
- Each track lasts at least 10 frames.

Reconstructed 3D points: Camera's view.

Demo: chess-3D.avi

Be careful!

- CG object should occlude the real object behind it.
- But, it should not occlude the real object in front of it. Why does this problem happen? (chess-bad.avi)
