

OTHEXO

An enhanced hexareversi game

Features & Improvement

- Improved Graphics & Animation
- Redesigned Webpage
- Tournament Mode
- AI – THEXI

Original Hexareversi

Hexareversi

Algorithm for player X:

Algorithm for player Y:

Delay between moves (in msec):

Start

Reload

11	X	12	X	13	X	14	X	15	X								
21	X	22	Y	23		24	Y	25		26							
31	X	32	Y	33	X	34	Y	35	Y	36	X	37	X				
41	X	42	X	43	X	44	X	45	X	46	Y	47	X	48			
51	Y	52		53	X	54	X	55	X	56	X	57	Y	58		59	
62	Y	63	X	64	X	65	X	66	Y	67	Y	68	Y	69			
73	Y	74	Y	75	X	76	Y	77	X	78	X	79					
84	X	85		86	Y	87	X	88		89							
95	X	96	X	97	X	98	X	99									

X has 32 and Y has 16 pieces
Y moved successfully at 68

Graphics & Animation

- SVG drawn hexagon grid
 - SVG HTML5 design, lossless vector drawing
 - Size relative to client width & height
 - Each hexagon is an separate polygon, handled separately, stored in `hexagonarr[]`
 - The grid is only drawn once, colours updated using `reDraw()`
 - Drawn using `svg.js` library

Graphics & Animation

- Interactive hexagon grid

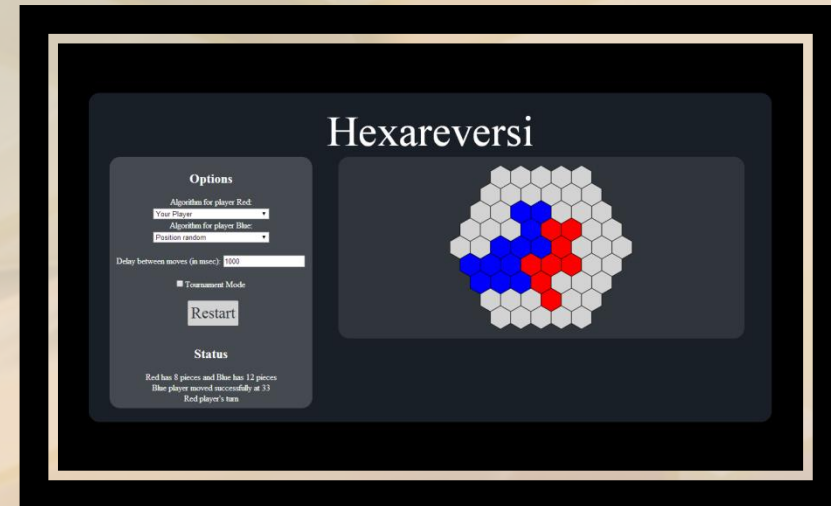

- `.mouseover()` animations
 - Highlights hexagon cells with current player's colour
- `.click()` events handled,
 - Cell clicked passed into "hidden + side" input as to preserve initial design
 - Checks that players are human and that it is their turn
- Converted hexagon cell animation
 - Cell rotate and switch colours when they are changed

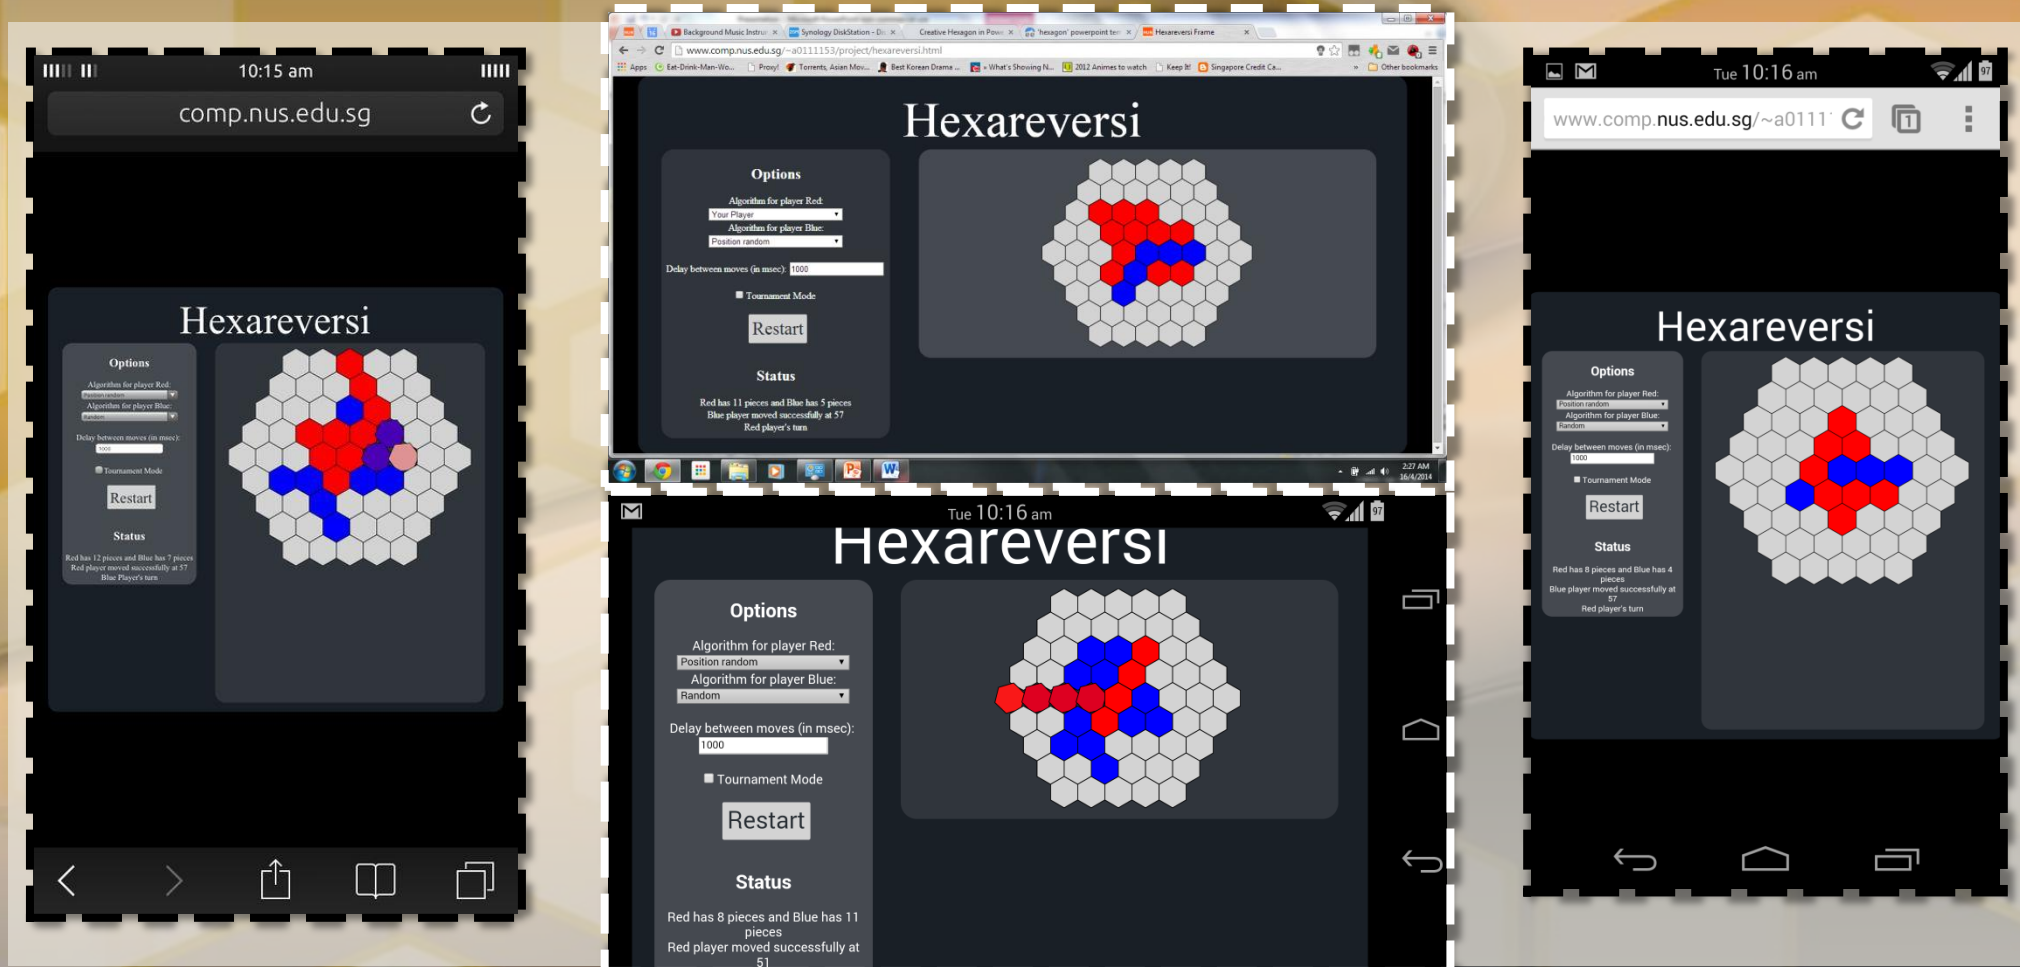

Redesigned Webpage

- Simple and intuitive user interface
 - Fluid and relative design, fits in one page,
 - Irrelevant options and grid hidden
- Compatible with modern PC and mobile browsers
 - Tested with Chrome, Safari, Firefox, IE 10, Android, IOS

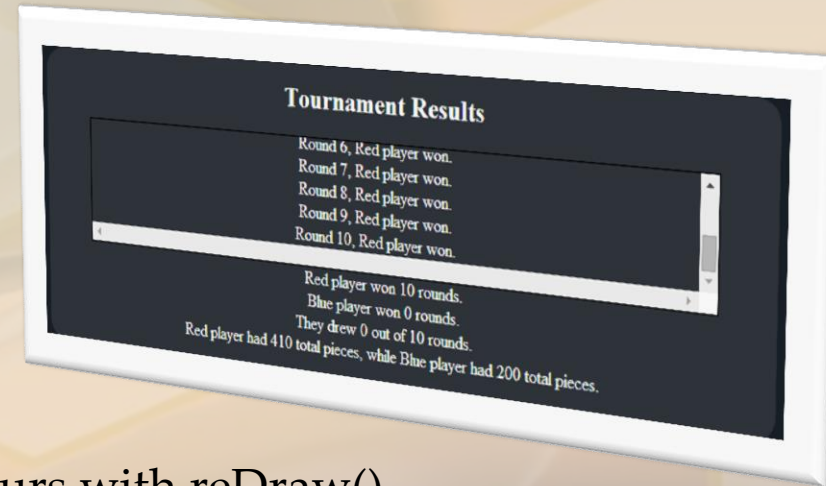

Redesigned Webpage

Tournament Mode

- Simulate AI vs AI
 - On the fly updating of results
 - Restarts by recycling Game instance
 - Avoids drawing hexagon grid, update colours with reDraw()
 - Implemented inside of Game class, handled internally
 - Preserves initial setTimeout() design

AI - THEXI

- Functions:
 - predictMove(simboard, predarray, count, initcell, initscore, userorenemy)
 - Check for valid moves in simboard, recurses itself to predict enemy moves
 - Recursion depth (count) can be adjusted for THEXI's difficulty – Set at 2, balance between performance & difficulty
 - moveOnce(board, cellnum, userorenemy)
 - Stimulates piece put down at cellnum in board
 - Converts affect cells in board

AI - THEXI

- Functions:
 - countPieces(board)
 - Calculates net score from board (player – opponent pieces)
- Variables
 - simboard
 - Registers player piece as 1, opponent as -1
 - Ensures player can be red or blue
 - predarray
 - Stores the evaluated value of each hexagon cell
 - THEXI will pick the highest value cell

Outline of THEXI

countPieces()
counts score,
passes it to
predictMove()

predictMove()
passes each
empty cell to
moveOnce()

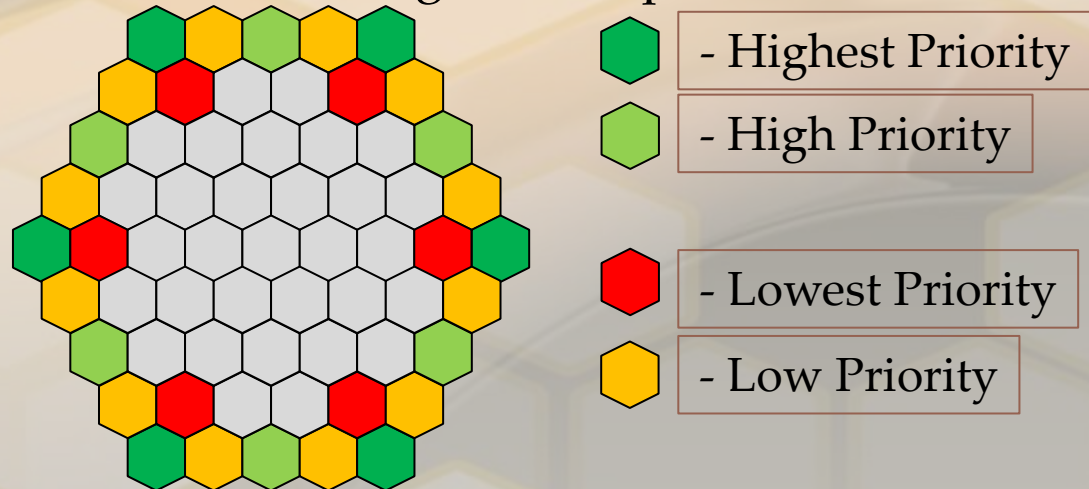

moveOnce()
returns if it's a
valid move, if
so
predictMove()
recurses and
switches side

predictMove()
compares
simulated
score with
initial score
and modifies
the value in
predarray[init
cell]

Cell with
highest value
in predarray[]
is returned

AI - THEXI

- Additional conditions THEXI considers:
 - More value is added to cells where opponents are forced to pass, and score is advantages to us.
 - predarray[] values are modified according to their positions too
