Group 4:

## COMPRESSED SENSING

## Equations

 $y = \Phi x$ 

 $y = \Phi \Psi \alpha$ 

 $x=\Psi\alpha$ 

## Magnitudes

- N The dimensionality (size) of the signal, e.g., pixels in an image.
- $\begin{array}{ll} K & \mbox{ Sparsity of the signal } x \\ & K \ll N \end{array}$
- $M \qquad \text{The dimensionality of the measurement} \\ K \leq M \ll N$

## Variables

- y The compressed measurement A  $M \times 1$  vector
- $\Phi \qquad \text{The sensing matrix} \\ A M \times N \text{ matrix} \end{cases}$
- x The original signal A  $N \times 1$  vector
- $\hat{x}$  The reconstructed signal A  $N \times 1$  vector
- $\alpha$  The signal represented in a base in which it is sparse A  $N \times 1$  vector
- $\Psi$  Transformation matrix, that transforms the signal into a sparse base A  $N \times N$  matrix
