

CS3231
Tutorial 7

1. Remove useless symbols from the following grammar using the algorithm done in class.

$$\begin{aligned} S &\rightarrow A|AA|AAA \\ A &\rightarrow ABa|ACa|a \\ B &\rightarrow ABa|Ab|\epsilon \\ C &\rightarrow Cab|CC \\ D &\rightarrow CD|Cd|CEa \\ E &\rightarrow b \end{aligned}$$

2. Eliminate ϵ productions from the grammar

$$\begin{aligned} S &\rightarrow ABaC \\ A &\rightarrow AB \\ B &\rightarrow b|\epsilon \\ C &\rightarrow D|\epsilon \\ D &\rightarrow d \end{aligned}$$

3. Remove all unit productions from the grammar

$$\begin{aligned} S &\rightarrow CBa|D \\ A &\rightarrow bbC \\ B &\rightarrow Sc|ddd \\ C &\rightarrow eA|f|C \\ D &\rightarrow E|SABC \\ E &\rightarrow gh \end{aligned}$$

4. Convert the following to Chomsky normal form grammar without useless symbols:

$$\begin{aligned} S &\rightarrow AB|CA \\ A &\rightarrow a \\ B &\rightarrow BC|AB \\ C &\rightarrow aB|b|ACC|\epsilon \end{aligned}$$

5. Could you give an algorithm to test whether the language generated by a CFG is (a) empty, (b) finite, (c) infinite?

6. Give an algorithm that constructs $Unit(A)$ for all nonterminals A in a CFG.
7. (Hard) Greibach Normal Form: A grammar is said to be in Greibach Normal Form, if all the productions in the grammar are of the form: $A \rightarrow a\alpha$, where a is a terminal and α is a string of zero or more variables (non-terminals). Prove that, for every non-empty context free language L , which does not contain ϵ , one can have a Greibach Normal Form grammar.

Hint: Assume the original grammar given for the language L is in Chomsky Normal form. Assume that the variables in the grammar are A_1, \dots, A_m . Let G_0 be the original grammar.

(a) First, inductively define G_i (generating the same language L) to have the following properties:

(P1) G_i has variables A_1, \dots, A_m and B_1, \dots, B_i ,

(P2) all the productions of G_i are of form (i) $A_j \rightarrow \alpha$ (where α starts with either a terminal, or a variable A_r , with $r \geq \min(i + 1, j + 1)$), OR (ii) $B_j \rightarrow \alpha$, where α starts with a terminal or A_k for some k .

The above can be achieved as follows. Suppose in G_{i-1} we have productions of the form $A_i \rightarrow \alpha_1 \mid \alpha_2 \mid \dots \mid \alpha_r$ and $A_i \rightarrow A_i\beta_1 \mid A_i\beta_2 \mid \dots \mid A_i\beta_w$, where α_s either start with a terminal or A_k for some $k > i$ (note that by inductive property P2, above holds). Now replace the above productions by:

$$A_i \rightarrow \alpha_1 B_i \mid \alpha_2 B_i \mid \dots \mid \alpha_r B_i$$

$$A_i \rightarrow \alpha_1 \mid \alpha_2 \mid \dots \mid \alpha_r$$

and

$$B_i \rightarrow \beta_1 \mid \beta_2 \mid \dots \mid \beta_w,$$

$$B_i \rightarrow \beta_1 B_i \mid \beta_2 B_i \mid \dots \mid \beta_w B_i$$

Here if β_r starts with a B_r , $r < i$, then replace B_r in these productions by the RHS of all productions of B_r .

(note that above is “correct” replacement as the language generated does not change).

Now for $j > i$, replace each production in G_{i-1} of form $A_j \rightarrow A_i\gamma$ by the set of productions $A_j \rightarrow \alpha_1 B_i\gamma \mid \alpha_2 B_i\gamma \dots \mid \alpha_r B_i\gamma$ and

$$A_j \rightarrow \alpha_1\gamma \mid \alpha_2\gamma \dots \mid \alpha_r\gamma.$$

Now verify that the grammar so generated, G_i , satisfies the properties (P1) and (P2).

(b) Let us rename the variables in G_m as

B_i renamed to C_i

A_j renamed to C_{m+j} .

Then, we have the property that any production of form $C_r \rightarrow \alpha$, has α starting with either a terminal or a variable C_w , where $w > r$. Use this property to convert the grammar into Greibach normal form.
