- Outlook: Natural Deduction for Propositional Logic

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# **Beyond Traditional Logic**

## Not just sets

How to express this using traditional logic?

- "1 + 1 = 3"
- "The sun is shining today."
- "Earth has more mass than Mars."

#### Arguments as Propositions

How to formalize a proposition of the form

If  $p_1$  then  $p_2$ ?

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# Atoms

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

## Anything goes

We allow any kind of proposition, for example "The sun is shining today".

### Convention

We usually use p, q,  $p_1$ , etc, instead of sentences like "The sun is shining today".

#### Atoms

More formally, we fix a set A of propositional atoms.

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# Meaning of Atoms

Motivation **Propositional Atoms** Constructing Propositions Syntax of Propositional Logic

### Models assign truth values

A model assigns truth values (F or T) to each atom.

### More formally

A model for a propositional logic for the set A of atoms is a mapping from A to  $\{T, F\}$ .

### How do you call them?

Models for propositional logic are called valuations.

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

Motivation **Propositional Atoms** Constructing Propositions Syntax of Propositional Logic

### Example

Some valuation Let  $A = \{p, q, r\}$ . Then a valuation  $v_1$  might assign p to T, q to F and r to T.

#### More formally

$$p^{v_1} = T, q^{v_1} = F, r^{v_1} = T.$$
  
write  $v_1(p)$  instead of  $p^{v_1}$ 

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# **Building Propositions**

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

We would like to build larger propositions, such as arguments, out of smaller ones, such as propositional atoms. We do this using *operators* that can be applied to propositions, and yield propositions.

Motivation

**Propositional Atoms** 

**Constructing Propositions** 

Syntax of Propositional Logic

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# **Unary Operators**

Let *p* be an atom.

### All possibilities

The following options exist:

**1** 
$$p^{v} = F: (op(p))^{v} = F. p^{v} = T: (op(p))^{v} = F.$$

**3** 
$$p^{v} = F$$
:  $(op(p))^{v} = T$ .  $p^{v} = T$ :  $(op(p))^{v} = T$ .

**3** 
$$p^{v} = F$$
:  $(op(p))^{v} = F$ .  $p^{v} = T$ :  $(op(p))^{v} = T$ .

**3** 
$$p^{\nu} = F$$
:  $(op(p))^{\nu} = T$ .  $p^{\nu} = T$ :  $(op(p))^{\nu} = F$ .

The fourth operator *negates* its argument, *T* becomes *F* and *F* becomes *T*. We call this operator *negation*, and write  $\neg p$  (pronounced "not p").

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

# Nullary Operators are Constants

#### The constant op

The constant  $\top$  always evaluates to *T*, regardless of the valuation.

#### The constant $\perp$

The constant  $\perp$  always evaluates to *F*, regardless of the valuation.

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# **Three Famous Ones**

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

- $op_2$ :  $op_2(p,q)$  is T when p is T and q is T, and F otherwise. Called *conjunction*, denoted  $p \land q$ .
- $op_8$ :  $op_8(p,q)$  is T when p is T or q is T, and F otherwise. Called *disjunction*, denoted  $p \lor q$ .
- $op_{14}$  :  $op_{14}(p,q)$  is T when p is F or q is T, and F otherwise. Called *implication*, denoted  $p \rightarrow q$ .

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# **Inductive Definition**

### Definition

For a given set *A* of propositional atoms, the set of *well-formed formulas in propositional logic* is the smallest set *F* that fulfills the following rules:

- The constant symbols  $\perp$  and  $\top$  are in *F*.
- Every element of A is in F.
- If  $\phi$  is in *F*, then  $(\neg \phi)$  is also in *F*.
- If  $\phi$  and  $\psi$  are in *F*, then  $(\phi \land \psi)$  is also in *F*.
- If  $\phi$  and  $\psi$  are in *F*, then  $(\phi \lor \psi)$  is also in *F*.
- If  $\phi$  and  $\psi$  are in *F*, then  $(\phi \rightarrow \psi)$  is also in *F*.

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# Notes on Defining Sets

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

### Are there more sets that fulfill these rules?

The set of *all formula defined in this module* fulfills these rules. The clause "the smallest set" eliminates those elements that are not *forced in* through any of the given rules.

#### Observe

Some rules are simple (they do not have any condition), whereas others assume one or two formulas in the set as given, and then require that another forumula is also in the set.

#### Inductively defined sets

A set defined in this way is called an *inductively defined set*.

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

# $(((\neg p) \land q) \rightarrow (\top \land (q \lor (\neg r))))$

### is a well-formed formula in propositional logic.

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

# More Compact in Backus-Naur-Form (BNF)

# $\phi ::= \boldsymbol{\rho} \mid \bot \mid \top \mid (\neg \phi) \mid (\phi \land \phi) \mid (\phi \lor \phi) \mid (\phi \to \phi)$

The Importance of Being Formal 03—Propositional Logic I

Semantics of Propositional Logic Outlook: Natural Deduction for Propositional Logic

# Convention

Motivation Propositional Atoms Constructing Propositions Syntax of Propositional Logic

The negation symbol  $\neg$  binds more tightly than  $\land$  and  $\lor$ , and  $\land$  and  $\lor$  bind more tightly than  $\rightarrow$ . Moreover,  $\rightarrow$  is *right-associative*: The formula  $p \rightarrow q \rightarrow r$  is read as  $p \rightarrow (q \rightarrow r)$ .

#### Example

$$(((\neg p) \land q) \rightarrow (p \land (q \lor (\neg r))))$$

can be written as

$$\neg p \land q \rightarrow p \land (q \lor \neg r)$$

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# **Negating Truth Values**

#### Definition

Function  $\setminus : \{F, T\} \rightarrow \{F, T\}$  given in truth table:

$$\begin{array}{c|c}
B & \backslash B \\
\hline
F & T \\
T & F
\end{array}$$

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# **Conjunction of Truth Values**

#### Definition

Function & :  $\{F, T\} \times \{F, T\} \rightarrow \{F, T\}$  given in truth table:

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# **Disjunction of Truth Values**

### Definition

Function  $|: \{F, T\} \times \{F, T\} \rightarrow \{F, T\}$  given in truth table:

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# Implication of Truth Values

### Definition

Function  $\Rightarrow: \{F, T\} \times \{F, T\} \rightarrow \{F, T\}$  given in truth table:

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# **Evaluation of Formulas**

### Definition

The result of *evaluating* a well-formed propositional formula  $\phi$  with respect to a valuation v, denoted  $v(\phi)$  is defined as follows:

- If  $\phi$  is the constant  $\bot$ , then  $v(\phi) = F$ .
- If  $\phi$  is the constant  $\top$ , then  $v(\phi) = T$ .
- If  $\phi$  is an propositional atom p, then  $v(\phi) = p^{v}$ .
- If  $\phi$  has the form  $(\neg \psi)$ , then  $v(\phi) = \setminus v(\psi)$ .
- If  $\phi$  has the form  $(\psi \wedge \tau)$ , then  $v(\phi) = v(\psi) \& v(\tau)$ .
- If  $\phi$  has the form  $(\psi \lor \tau)$ , then  $v(\phi) = v(\psi) | v(\tau)$ .
- If  $\phi$  has the form  $(\psi \to \tau)$ , then  $v(\phi) = v(\psi) \Rightarrow v(\tau)$ .

# Valid Formulas

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

## Definition

A formula is called *valid* if it evaluates to T with respect to every possible valuation.

# Examples

### Example

ls

 $(((\neg p) \land q) \rightarrow (\top \land (q \lor (\neg r))))$ 

valid?

### Example

Find a valid formula that contains the propositional atoms p, q, r and w.

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# Meaning of propositional formula

#### Meaning as mathematical object

We define the meaning of formulas as a function that maps formulas and valuations to truth values.

#### Approach

We define this mapping based on the structure of the formula, using the meaning of their logical connectives.

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

## Truth values and valuations

#### Definition

The set of truth values contains two elements T and F, where T represents "true" and F represents "false".

#### Definition

A *valuation* or *model* of a formula  $\phi$  is an assignment of each propositional atom in  $\phi$  to a truth value.

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# Meaning of logical connectives

The meaning of a connective is defined as a truth table that gives the truth value of a formula, whose root symbol is the connective, based on the truth values of its components.

| $\phi$ | $\psi$ | $\phi \wedge \psi$ |
|--------|--------|--------------------|
| Т      | Т      | Т                  |
| Т      | F      | F                  |
| F      | Т      | F                  |
| F      | F      | F                  |

**Operations on Truth Values Evaluation of Formulas** Validity and Satisfiability

# Truth tables of formulas

Truth tables use placeholders of formulas such as  $\phi$ :

| $\phi$ | $\psi$ | $\phi$ | $\wedge \psi$  |                         |
|--------|--------|--------|----------------|-------------------------|
| Т      | Т      |        | Г              |                         |
| Т      | F      | 1      | E              |                         |
| F      | Т      | 1      | E              |                         |
| F      | F      | 1      | E              |                         |
| Buil   | d th   | e tru  |                | or given formula:       |
| р      | q      | r      | $(p \wedge q)$ | $((p \land q) \land r)$ |
| Т      | Н      | Т      | Т              | Т                       |
| Т      | Т      | F      | Т              | F                       |
|        |        |        |                |                         |

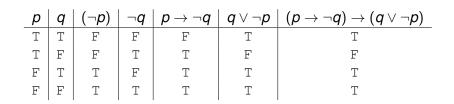

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

## Truth tables of other connectives

| $\phi$      | $ \psi$          | $\phi \lor \psi$ | $\phi$ | $ \psi$     | $\phi \to \psi$ |
|-------------|------------------|------------------|--------|-------------|-----------------|

| F           | T<br>F<br>T<br>F | F                | F      | F<br>T<br>F | Т               |
| ф<br>Т<br>F | -<br>            |                  | <br>   | <u> </u>    |                 |

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# Constructing the truth table of a formula

Operations on Truth Values Evaluation of Formulas Validity and Satisfiability

# Validity and Satisfiability

#### Validity

A formula is *valid* if it computes T for all its valuations.

#### Satisfiability

A formula is *satisfiable* if it computes T for at least one of its valuations.

2 Semantics of Propositional Logic

- Outlook: Natural Deduction for Propositional Logic
  - Sequents

# Introduction

#### Objective

We would like to develop a *calculus* for reasoning about propositions, so that we can establish the validity of statements such as "If the train arrives late...".

#### Idea

We introduce *proof rules* that allow us to derive a formula  $\psi$  from a number of other formulas  $\phi_1, \phi_2, \dots \phi_n$ .

#### Notation

We write a *sequent*  $\phi_1, \phi_2, \ldots, \phi_n \vdash \psi$  to denote that we can derive  $\psi$  from  $\phi_1, \phi_2, \ldots, \phi_n$ .

# **Example**—Revisited

#### English

If the train arrives late and there are no taxis at the station, then John is late for his meeting.

John is not late for his meeting. The train did arrive late.

Therefore, there were taxis at the station.

#### Sequent

$$p \land \neg q \to r, \neg r, p \vdash q$$

#### Remaining task

Find proof rules that allow us to establish such sequents.
