INSTRUCTIONS TO CANDIDATES

1. This test paper consists of ELEVEN (11) questions and comprises THIRTEEN (13) printed pages.

2. This is a CLOSED BOOK test. You are allowed to bring in ONE (1) piece of handwritten (not printed or photocopied) A4 double-sided reference sheet.

3. Answer all questions only on the ANSWER SHEETS provided.

4. We will collect only the Answer sheets from you.

5. The total mark for this paper is 40.
Questions 1 - 6: For each of these multiple-choice questions, there is only one correct answer. Each correct answer is worth one mark, and there is no penalty for wrong answers.

1. Which of the following statements is false?
   (A) A .java file may contain more than one class.
   (B) When you create an instantiable class, you must include a default constructor (a constructor with no parameter).
   (C) Not every class needs to have a main() method.
   (D) A class may contain a mix of class methods and instance methods.
   (E) All methods in the Math class are class methods.

2. Assuming that list, which is an ArrayList, contains at least 3 elements, and you want to shift its last element into its second position. For instance, if list originally contains [“A”, “B”, “C”, “D”, “E”], then after the shift it becomes [“A”, “E”, “B”, “C”, “D”].
   Which of the following statements to perform the shift is correct?
   (A) list.add(list.remove(list.size()), 2);
   (B) list.add(list.remove(list.size()-1), 1);
   (C) list.add(2, list.remove(list.size()-1));
   (D) list.add(1, list.remove(list.size()));
   (E) list.add(1, list.remove(list.size()-1));

3. Given the following interface I:

   ```java
   public interface I {
       public double f(int a);
       public int g(double b);
   }
   ```

   The following class F implements the above interface I:

   ```java
   public class F implements I {
       public static double a = 2.5;
       public double f(int b) {
           return b * (b+1);
       }
   }
   ```

   Compilation of the class F yields some error. What is/are the reasons?
   i. The class F cannot be public.
   ii. The statement “public static double a = 2.5;” must be removed.
   iii. The parameter b in f() must be named a instead.
   iv. The implementation of method g() is missing.
4. A mathematical model of the data objects that make up a data type as well as the set of operations defined on these objects is called a/an _____________________.

(A) Abstract Data Type
(B) Data Structure
(C) Primitive Data Type
(D) Encapsulation
(E) Algorithm

5. What is the output of the following code fragment?

```java
for (int i=1; i<=2; i++) {
    try {
        System.out.print("A");
        if (i == 1) throw new Exception();
        System.out.print("B");
        if (i == 2) throw new ArithmeticException();
        System.out.print("C");
    }
    catch (ArithmeticException e) {
        System.out.print("D");
        break;
    }
    catch (Exception e) {
        System.out.print("E");
    }
    finally {
        System.out.print("F");
    }
}
```

(A) AEABD
(B) AEABDF
(C) AEFABD
(D) AEFABDF
(E) AEBCFABDCF
6. In the program below, \texttt{story} is an array of strings containing 4 lines of text.

```java
public class ArrayOfStrings {
    public static void main(String[] args) {
        String[] story = {
            "This is a little story about four people named ",
            "Everybody, Somebody, Anybody and Nobody.",
            "There was an important job to be done and ",
            "Everybody was sure that Somebody would do it."};

        int count = 0;
        for (int i=0; i<story.length; i++) {
            if ((story[i].indexOf("body") > -1) &&
                (story[i].indexOf("body") == story[i].lastIndexOf("body"))) {
                count++;
            }
        }
    }
}
```

Which of the following describes the result in the variable \texttt{count}?

(A) The number of times the word “body” appears in story.
(B) The number of lines where the word “body” does not appear at all.
(C) The number of lines where the word “body” appears exactly once.
(D) The number of lines where the word “body” appears at least once.
(E) The number of lines where the word “body” appears exactly twice.
7. Given the following overloaded method $m()$ of a class $M$:

```java
public static double m(int a, int b) {
    return a * b;
}

public static double m(double a, int b) {
    return a * b * 2;
}

public static double m(double a, double b) {
    return a * b * 3;
}
```

What is the output of the following statements? If there is an error, write “error” in your answer.  

a) `System.out.println(M.m(4.0, 5));`

b) `System.out.println(M.m(4, 5.0));`
8. Given the following class `S`:

```java
class S {
    private static int v1 = 0;
    private int v2, v3;

    public S() {
        this(0, 1);
    }

    public S(int x, int y) {
        this.v2 = x;
        this.v3 = y;
    }

    public static int getv1() {
        return v1;
    }

    public int getv2() {
        return v2;
    }

    public int getv3() {
        return v3;
    }

    public void m1(int v) {
        v1 += v;
    }

    public void m2(int v) {
        v2 += v;
        v3 += v2;
    }

    public int m3(int v) {
        int v3 = v;
        v3 += v2;
        return v3;
    }
}
```
8. (continued…)  
What is the output of the following program?  

```java
public class TestS {  
    public static void main(String[] args) {  
        S s1 = new S();  
        S s2 = new S(7, 8);  
        
s1.m1(5);  
s2.m1(5);  
s1.m2(5);  
        int x = s2.m3(5);  
        System.out.print(S.getv1() + "", "");  
        System.out.print(s1.getv3() + "", "");  
        System.out.print(s2.getv3() + "", "");  
        System.out.println(x);  
    }  
}
```

9. Given the following class **Die**:

```java
import java.util.*;  

class Die {  
    private Random num;  
    
    public Die() {  
        num = new Random();  
    }  
    
    public int toss() {  
        return num.nextInt(6) + 1;  
    }  
}
```

Write a program **Game.java** to toss a die 1000 times and determine which value (1 through 6) has appeared the most frequently, and the number of times it appeared.

Below is a sample run of the program. If there are more than one value that appeared most frequently, report any of them. The skeleton program is given on the Answer Sheets and you are not supposed to change what is given in the code.  

3 appeared most frequently, a total of 183 times.
10. [7 marks]  
A **MyRect** class has been defined for rectangles whose sides are parallel to either the x-axis or y-axis. It consists of 2 attributes: **vertex1** and **vertex2** representing the south-west corner and north-east corner of a rectangle respectively. Both corners are objects of the **Point** class defined in Java API. Information on the **Point** class is given in Appendix A.

The diagram below shows an example of a **MyRect** object with vertex1 at (3, -2) and vertex2 at (8, 1).

![Diagram showing MyRect object]

The **MyRect** class is shown below.

```java
import java.awt.*;

class MyRect {
    /************** Data members **********************/
    private Point vertex1, vertex2;

    /************** Constructor **********************/
    public MyRect(Point v1, Point v2) {
        setVertex1(new Point(v1));
        setVertex2(new Point(v2));
    }

    /************** Accessors ***********************/
    public Point getVertex1() { return vertex1; }
    public Point getVertex2() { return vertex2; }

    /************** Mutators ***********************/
    public void setVertex1(Point pt) { vertex1 = pt; }
    public void setVertex2(Point pt) { vertex2 = pt; }

    /************** Overriding methods **************/
    // Overriding toString() method not shown here
    // Overriding equals() method not shown here
}
```
10. (continued…)
   a. As we want every **MyRect** object created to have its south-west corner at vertex1
      and north-east corner at vertex2, if the user passes in a different pair of opposite
      vertices of a rectangle, say (3, 1) and (8, -2) to the constructor, the object created
      will not have the right values for its two vertices.

      Hence, we need to modify the constructor such that regardless of which pair of
      opposite vertices is passed to the constructor, it places the south-west corner at
      vertex1 and the north-east corner at vertex 2. Modify the constructor. [5 marks]

   b. We want to add a default constructor **MyRect().** This constructor creates a
      rectangle with vertices at (0, 0) and (1, 1). The body of the constructor should
      contain a single statement. [1 mark]

   c. We are considering changing the two mutators into private methods. What is the
      reason? [1 mark]
11. [13 marks]

A city has towns that occupy rectangular plots of land. Towns may overlap. Each town is represented by its south-west point (vertex 1) and north-east point (vertex 2). The x- and y-coordinates fall in the closed range [0, 1000].

A client program `CityPlanner.java` reads a list of towns into an array of `MyRect` objects. (`MyRect` is defined in the previous question.) You may assume that there are at least 2 towns. You may also assume that the array used is a normal array or an `ArrayList`. (Information on the `ArrayList` class is given in Appendix B.)

Let’s call this array `towns`.

You are to complete `CityPlanner.java` with the following tasks:

a. Find and return the bounding rectangle of the towns. A bounding rectangle is the smallest rectangle that covers all the towns. [6 marks]

   ```java
   public static MyRect boundingRect(…)
   ```

b. Every town has a centre, which is the centre of the rectangle. In other words, the centre is equidistant from the four corners of the rectangle. Determine the minimum distance between the centres of any two towns. (Your solution should use a certain `Math` method.) [7 marks]

   ```java
   public static double minDistBtwPair(…)
   ```

The following example shows 5 towns (not drawn to scale) and the answers for the above tasks. Note that this is only one example. The list of towns read from the user may not be the same as shown here.

- Bounding rectangle has vertices at (20, 12) and (380, 190).
- Minimum distance between the centres of any two towns = 43.4
  (The top-most town and the biggest town.)
