Propositional Logic, continued: Soundness, Completeness, & Special Forms

★ Soundness
★ Completeness
★ Conjunctive Normal Form
★ Horn Clauses

Soundness (1)

- Suppose $\Phi_1, \ldots, \Phi_k \vdash \Psi$ holds.
- Hence, there is a proof of $\Psi$ having $\Phi_1, \ldots, \Phi_k$ as premises.
- We proceed by induction on the length of these proofs. We need to reformulate the soundness statement such that it is amenable to induction.

$M(k):$ For all sequences $\Phi_1, \ldots, \Phi_k \vdash \Psi$ that have a proof of length $k$, it is the case that $\Phi_1, \ldots, \Phi_k \vdash \Psi$

We intend to use course-of-values induction on $k$.

- Technical problem:
  - Chopping a proof may not lead to correct sub-proofs, since some boxes may still be open.
  - However, a chopped proof (a prefix of the sequence of formulas representing a proof) may form a correct proof if the assumptions of the open boxes are added to the premises.

Soundness (2)

To solve our technical problem, we change the structure of the proof as in the following example. Consider the following sequent:

```
p \land q \rightarrow r, p \vdash (q \rightarrow r)
```

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>1</th>
<th>0</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td></td>
<td>(2)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>3</td>
<td></td>
<td>(2,3)</td>
<td>q</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>/2,3</td>
<td>(2,3)</td>
<td>p \land q</td>
<td>/2,3</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>=i1,4</td>
<td>(2,3)</td>
<td>r =i1,4</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
<td>/i5</td>
<td>(2)</td>
<td>q \rightarrow r =i5</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
<td>/i2-6</td>
<td>0</td>
<td>p \rightarrow (q \rightarrow r) =i2-6</td>
<td></td>
</tr>
</tbody>
</table>

Note: The set at the right of a formula in a proof line grows and shrinks as a stack, reflecting the way boxes are opened and closed.

Soundness (3)

Just for the purpose of proving soundness, we formally change the definition of the proof as follows.

**Definition:** A proof of the sequent $\Gamma \vdash \Psi$ is a sequence of pairs $\langle (\chi_1, \delta_1), \ldots, (\chi_n, \delta_n) \rangle$ where:

1. $\delta_1 = \epsilon_\Gamma$;
2. Each $\delta_i$ is a subset of $\{1, \ldots, i\}$;
3. For each $i$, $\chi_i$ is either:
   - A premise (i.e., $\chi_i \in \Gamma$) or
   - An assumption ($\chi_i \in \delta_i$) or
   - $\chi_i$ follows from previous lines by applying deduction rules;
4. For each $i$, $\delta_i$ is equal to:
   - $\delta_{i-1}$ if no box was closed/opened at line $\chi_i$
   - $\delta_{i-1} \cup \{\chi_i\}$ if a box is opened on line $\chi_i$
   - $\delta_{i-1} \setminus \{\chi_i\}$ if a box with assumption at line $\chi_i$ was closed.

The length of such a proof is $k$.

Soundness (4)

Our inductive statement now becomes:

For any proof of length $k$ $\langle (\chi_1, \delta_1), \ldots, (\chi_n, \delta_n) \rangle$, and any assignment of truth values that makes the premises in $\Gamma$ and the assumptions in $\delta_k$ true, it is the case that $\chi_k$ evaluates to $\top$.

When there is a chopping with no open boxes, this hypothesis precisely covers the semantic entailment.

Soundness (5)

We now proceed with the proof.

**Base case $k = 1$:** The proof has length 1, hence it is of the form

```
1 \ 0 \ \chi \  \text{premise}
```

The statement is obviously true, any assignment of truth values that makes all the premises true, shall make this premise true as well.

**Induction case $k > 1$:** Suppose we have a proof

```
1 \ 0 \ \chi \  \text{premise}
```

When $k \delta_1 \chi \text{ justification} = k$
Soundness (6)

Justification: It is a natural deduction rule, hence we proceed by case analysis.

Soundness (7)

\( \forall \alpha: \text{It must be the case that } x = x_1 \lor x_2 \text{, with } x_i \text{ appearing at line } k < k_i \text{, with } i \in \{1, 2\}. \) The formulas \( x_1 \lor x_2 \) have shorter proofs, and therefore, using the induction hypothesis, they have the truth value \( T \). Using the truth table for \( \lor \), we conclude that the truth value of \( x \) is \( T \).

\( \forall \beta: \text{It must be the case that some formula } x_1 \lor x_2 \text{ appears in the proof, and that we have two boxes with assumptions } \beta_1 \text{ and } \beta_2 \text{, and conclusion } x_1 \lor x_2. \) The proof of \( x_1 \lor x_2 \) is shorter hence, according to the induction hypothesis, it has a truth value of \( T \). According to the truth table of \( \lor \), either \( \beta_1 \) or \( \beta_2 \) have the truth value \( T \). Assume it is \( \beta_1 \) (the case when \( \beta_2 \) has a truth value of \( T \) is similar). Then the assumption \( \beta_2 \) of the second box is true, and using the induction hypothesis, its conclusion \( x \) has the truth value \( T \).

The other cases are similar.

Completeness (1)

**Theorem:** Whenever \( \Phi_1, \ldots, \Phi_n \models \Psi \) holds, there exists a natural deduction proof for the sequent \( \Phi_1, \ldots, \Phi_n \vdash \Psi \).

The proof consists of three steps:

1. **Step 1:** \( \models \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \)
2. **Step 2:** \( \models \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \)
3. **Step 3:** \( \models \Phi_1, \ldots, \Phi_n \vdash \Psi \)

**Definition:** A formula of propositional logic is a tautology if it is true for all assignments of truth values to its propositional atoms, i.e., if \( \models \Phi \).

Completeness (2)

**Step 1:** \( \vdash \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \)

This step is easy. Suppose \( \Phi_1, \ldots, \Phi_n \models \Psi \) holds. The implication truth table shows that the only possibility for \( \models \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \) to fail is to have an assignment of truth values to its parts that results in all \( \Phi_1, \ldots, \Phi_n \) having the truth value \( T \) and \( \Psi \) having the truth value \( F \); but this is impossible, as it contradicts the hypothesis.

**Step 2:** \( \models \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \)

This step is also easy. Suppose \( \models \Phi_1 \rightarrow (\Phi_2 \rightarrow (\cdots (\Phi_n \rightarrow \Psi) \cdots)) \) holds, i.e., \( \Phi_1 \) has a natural deduction proof \( \Pi \). Then we augment this proof by adding the premises \( \Phi_1, \ldots, \Phi_n \) to the front and then using the rule \( \rightarrow \) at the end to produce \( \Psi \). In other words, we produce the proof:

Completeness (3)

The core of the completeness proof is Step 2, which requires to show the following:

- If \( \models \Phi \) holds, then \( \vdash \Phi \) holds. In other words, if \( P \Phi \) is a tautology, then \( \Phi \) is a theorem.

The idea of the proof is the following:

- **Suppose \( \vdash \Phi \) holds.**
- **If formula \( \Psi \) has \( n \) atoms \( \phi_1, \ldots, \phi_n \), then \( \Phi \) has truth value \( T \) for all the \( 2^n \) lines in its truth table.**
- **Then, we "execute" each line in the truth table of \( \Phi \) as a sequent and assemble them into a proof of \( \Phi \) using the disjunction rules.**

Completeness (4)

The first part of the proof is based on the following lemma.

**Lemma:** Let \( \Phi \) be a formula containing the propositional atoms \( \Phi_1, \ldots, \Phi_n \) and \( l \) a line of \( \Phi \)'s truth table. Let \( \tilde{\beta}_i \) be \( \beta_i \) if the entry in line \( l \) of \( \beta_i \) is \( F \); otherwise, \( \tilde{\beta}_i \) is \( \neg \). Then,

\( \tilde{\beta}_1, \ldots, \tilde{\beta}_n \vdash \Phi \) is provable if the entry \( \text{for } \Phi \) in line \( l \) is \( F \);

\( \tilde{\beta}_1, \ldots, \tilde{\beta}_n \vdash \neg \Phi \) is provable if the entry \( \text{for } \Phi \) in line \( l \) is \( F \).
Completeness (5)

The proof of the lemma is by course of values induction on the height of the syntax tree of $\Phi$.

Base case: If $\Phi$ is an atom (i.e., a formula of height 1), then we have to show that $p \models p$ and $\neg p \models \neg p$ hold. This is immediate.

Completeness (9)

Induction case: The height of $\Phi$ is greater than 1. Then, we have the following cases:

- If $\Phi$ is of the form $\neg \Phi_1$, we have $\Phi \models T$, then $\Phi_1$ evaluates to $F$; $\Phi_1$ has the same atoms as $\Phi$, but a lower height, hence by induction hypothesis $p_1, \ldots, p_h \vdash \Phi_1$; finally $\neg \Phi_1 \models \neg \Phi_2$; hence we are done.

- If $\Phi$ is of the form $\Phi_1 \lor \Phi_2$, where $\sigma \in \{\land, \lor\}$. Let $\Phi_1$, $\Phi_2$ be the atoms of $\Phi_1$ and $\Phi_2$, respectively. Then, we consider the following cases:

  - Case 1: $\Phi_1 \land \Phi_2$.
    - If $\Phi_1$ evaluates to $T$ and $\Phi_2$ evaluates to $F$, then by the induction hypothesis $p_1, \ldots, p_h \vdash \Phi_1$, hence $p_1, \ldots, p_h \vdash \Phi_1 \land \Phi_2$, and we are done.
    - If $\Phi_1$ evaluates to $F$ and $\Phi_2$ evaluates to $T$, then we have $p_1, \ldots, p_h \not\vdash \Phi_1$ and $p_1, \ldots, p_h \vdash \Phi_2$, hence $p_1, \ldots, p_h \vdash \neg \Phi_1 \land \Phi_2$. We are left with proving $p_1, \ldots, p_h \vdash \neg \Phi_1 \land \Phi_2$ implies $p_1, \ldots, p_h \vdash \neg (\Phi_1 \land \Phi_2)$ (left as an exercise).

Completeness (7)

We show the proof for $\sigma = \land$, that is, we consider the case where $\Phi = \Phi_1 \land \Phi_2$.

- If both $\Phi_1$ and $\Phi_2$ evaluate to $T$, then by the induction hypothesis $p_1, \ldots, p_h \vdash \Phi_1$ and $p_1, \ldots, p_h \vdash \Phi_2$, hence $p_1, \ldots, p_h \vdash \Phi_1 \land \Phi_2$, and we are done.

Completeness (10)

The last piece of the puzzle is to assemble these proofs of the form $p_1, \ldots, p_h \vdash \Phi$

each representing a line in the truth table, into a proof of $\vdash \Phi$, without premises.

We use the disjunction rules to generate the lines of the truth table, then we appropriately insert the above proofs.

As we exemplify this procedure for the case of two atoms, for the tautology $\vdash p \lor q \rightarrow p$:

<table>
<thead>
<tr>
<th>Step</th>
<th>Formula</th>
<th>Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$p \models p$</td>
<td>LEM</td>
</tr>
<tr>
<td>2</td>
<td>$p$</td>
<td>ass</td>
</tr>
<tr>
<td>3</td>
<td>$q \lor q$</td>
<td>LEM</td>
</tr>
<tr>
<td>4</td>
<td>$q$</td>
<td>ass</td>
</tr>
<tr>
<td>5</td>
<td>$\lor$</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>$p \lor q$</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>$p \lor q$</td>
<td>ass</td>
</tr>
<tr>
<td>8</td>
<td>$p \lor q$</td>
<td>ass</td>
</tr>
<tr>
<td>9</td>
<td>$p \lor q$</td>
<td>ass</td>
</tr>
</tbody>
</table>

We use the disjunction rules to generate the lines of the truth table, then we appropriately insert the above proofs.
Semantic Equivalence & Validity

Definitions:
- Let $\Phi$ and $\Psi$ be propositional logic formulas. They are **semantically equivalent** if $\models \Phi \iff \models \Psi$. We denote this by $\Phi \equiv \Psi$.
- $\Phi$ is valid if $\models \Phi$.

Remarks:
- Two formulas $\Phi$ and $\Psi$ are semantically equivalent iff $\models (\Phi \rightarrow \Psi) \land (\Psi \rightarrow \Phi)$.
- Because of soundness and completeness of propositional logic, semantic equivalence is identical with provable equivalence $\vdash (\Phi \rightarrow \Psi) \land (\Psi \rightarrow \Phi)$.
- Our aim is to transform formulas into equivalent ones for which checking validity is easier.

Conjunctive Normal Form

Definitions:
- A literal is either an atom $p_i$ or the negation of an atom $\neg p_i$.
- A formula $\Phi$ is in **conjunctive normal form (CNF)** if it is of the form $\Psi_1 \land \Psi_2 \land \cdots \land \Psi_n$, for some $n \geq 1$, where each $\Psi_i$ is a disjunction of literals, for all $i \in \{1, \ldots, n\}$.

Note: Sometimes we include the case $n = 0$, in which case, by convention, the term is $T$.

Examples of CNFs:
- $\neg q \lor p \lor \neg r \land q$
- $p \lor q \lor \neg r \land p \lor \neg r$

Not in CNF:
- $\neg q \lor p \lor \neg r \land \neg q \lor \neg r$

Validity of a Disjunction of Literals

**Lemma:** A disjunction of literals $L_1 \lor L_2 \lor \cdots \lor L_n$ is valid iff there exist $i, j$ with $1 \leq i, j \leq n$, such that $L_i \land \neg L_j$.

**Proof:**
- If there exist $i, j$ such that $L_i \land \neg L_j$, then clearly $L_1 \lor L_2 \lor \cdots \lor L_n$ evaluates to $T$ for all assignments.
- For the converse, if no literal has a matching negation, then
  - For each positive literal we assign $T$ to the corresponding atom.
  - For each negative literal we assign $F$ to the corresponding atom.
  - This assignment falsifies the disjunction, which is impossible. (Example: for $\neg a \lor p \lor \neg r$, take $p$ and $r$ to be true, and $a$ to be false and $q$ to be true.)
- Hence, there exist $i, j$ such that $L_i \land \neg L_j$.

Satisfiability

**Definition:** A formula $\Phi$ is satisfiable if there exists an assignment of truth values to its propositional atoms such that $\Phi$ is true.

**Proposition:** A propositional logic formula $\Phi$ is satisfiable iff $\neg \Phi$ is not valid.

**Proof:**
- If $\Phi$ is satisfiable, then there exists a valuation assignment of truth values to its atoms which makes $\Phi$ true. For this valuation $\neg \Phi$ has the truth value $F$, hence $\neg \Phi$ cannot be valid.
- Conversely, if $\neg \Phi$ is not valid, then there exists a valuation for which $\neg \Phi$ has the truth value $F$. This valuation makes $\Phi$ have the truth value $T$, hence $\Phi$ is satisfiable.

This is a simple, but very useful result.

A Procedure to Compute CNFs

We present an algorithm to compute a CNF formula equivalent to a given arbitrary formula $\Phi$. The algorithm is deterministic and computes a unique CNF for any formula.

The algorithm is described as

```
CNF_NNF_IMPLFREE(\Phi)
```

for a given formula $\Phi$. The $\text{CNF}$, $\text{NNF}$, and $\text{IMPLEMENT}$ functions shall be discussed shortly.
**IMPLFREE**

function IMPLFREE(Φ) :  
// precondition: Φ is an arbitrary formula //  
// postcondition: returns an implication free formula equivalent to Φ //
begin function  
case  
Φ is a literal: return Φ  
Φ is ¬Φ₁: return IMPLFREE(Φ₂)  
Φ is Φ₁ ∧ Φ₂: return IMPLFREE(Φ₁) ∧ IMPLFREE(Φ₂)  
Φ is Φ₁ ∨ Φ₂: return IMPLFREE(Φ₁) ∨ IMPLFREE(Φ₂)  
Φ is Φ₁ → Φ₂: return ¬IMPLFREE(Φ₁) ∨ IMPLFREE(Φ₂)  
end case  
end function

**IMPLFREE Example**

Let Φ = ¬p ∧ q → p ∧ (r → q).

\[\text{IMPLFREE}(\Phi) = (p \land q) \lor (p \land (r \rightarrow q))\]

**NNF**

function NNF(Φ) :  
// precondition: Φ is implication free //  
// postcondition: returns an NNF formula equivalent to Φ //
begin function  
case  
Φ is a literal: return Φ  
Φ is ¬Φ₁: return NNF(Φ₂)  
Φ is Φ₁ ∧ Φ₂: return NNF(Φ₁) ∧ NNF(Φ₂)  
Φ is Φ₁ ∨ Φ₂: return NNF(Φ₁) ∨ NNF(Φ₂)  
Φ is Φ₁ → Φ₂: return ¬(Φ₁) ∨ (Φ₂)  
end case  
end function

**NNF Example**

Let Φ = ¬(¬p ∧ q) ∨ (p ∧ (¬q ∨ r)).

\[\text{NNF}(\Phi) = (p \land q) \lor (p \land (r \rightarrow q))\]

**CNF**

function CNF(Φ) :  
// precondition: Φ is implication free and in NNF //  
// postcondition: returns a CNF formula equivalent to Φ //
begin function  
case  
Φ is a literal: return Φ  
Φ is ¬Φ₁: return CNF(Φ₂)  
Φ is Φ₁ ∧ Φ₂: return CNF(Φ₁) ∨ CNF(Φ₂)  
Φ is Φ₁ ∨ Φ₂: return CNF(CNF(Φ₁), CNF(Φ₂))  
end case  
end function

**DISTR**

function DISTR(Φ₁, Φ₂) :  
// precondition: Φ₁, Φ₂ are in CNF //  
// postcondition: returns a CNF formula equivalent to Φ₁ ∨ Φ₂ //
begin function  
case  
Φ₁ is Φ₁₁ ∧ Φ₁₂: return DISTR(Φ₁₁, Φ₁₂) ∧ DISTR(Φ₁₂, Φ₁₂)  
Φ₂ is Φ₂₁ ∧ Φ₂₂: return DISTR(Φ₁₁, Φ₁₂) ∨ DISTR(Φ₁₂, Φ₁₂)  
otherwise: return Φ₁ ∨ Φ₂  
end case  
end function
**CNF Example**

Let \( \Phi = p \lor q \lor (p \land \neg r \land q) \).

\[
\begin{align*}
\text{CNF}(\Phi) &= \text{CNF}(p \lor q \lor (p \land \neg r \land q)) \\
&= \text{DISTR}(\text{CNF}(p \lor q) \land \text{CNF}(p \land \neg r \land q)) \\
&= \text{DISTR}(p \lor q \lor (p \land \neg r \land q)) \\
&= \text{DISTR}(p \lor q \lor (p \land \neg r \land q)) \\
&= (p \lor q \lor p) \land (p \lor q \lor \neg r \lor q) \\
&= (p \lor q) \land (p \lor q \lor \neg r \lor q)
\end{align*}
\]

**Horn Clauses**

Definitions:

- A **Horn clause** is a formula of the form \( p_1 \land p_2 \land \cdots \land p_k \rightarrow q \),
  where \( k \geq 1 \) and \( p_1, p_2, \ldots, p_k \) are atoms, \( \bot \) or \( T \).

- A **Horn formula** is a conjunction of Horn clauses, i.e. a formula \( \Phi \) of the form \( \Phi_1 \land \Phi_2 \land \cdots \land \Phi_n \) (\( n \geq 1 \)), such that each \( \Phi_i \) is a Horn clause, \( i \in \{1, \ldots, n\} \).

Horn clauses have an efficient procedure to decide their satisfiability, and are the basis for logic programming.

**Horn Clauses Examples**

Examples (yes)

\[
\begin{align*}
(p \lor q \lor s \rightarrow p) \land (q \lor r \rightarrow p) \land (p \land s \rightarrow s) \\
(p \lor q \lor s \rightarrow \bot) \land (q \lor r \rightarrow p) \land (T \rightarrow s) \\
(p_1 \land p_2 \land p_3 \land p_4 \land (T \rightarrow s) \land (p_5 \land p_6 \rightarrow \bot))
\end{align*}
\]

Examples (no)

\[
\begin{align*}
(p \lor q \lor s \rightarrow p) \land (q \lor r \rightarrow p) \land (p \land s \rightarrow s) \\
(p \lor q \lor s \rightarrow \bot) \land (q \lor r \rightarrow p) \land (T \rightarrow s) \\
(p_1 \land p_2 \land p_3 \rightarrow p_1 \land p_2 \land (T \rightarrow s) \land (p_5 \lor p_6 \rightarrow \bot))
\end{align*}
\]

**HORN**

**function** HORN(\( \Phi \) : 
\( P \) precondition: \( \Phi \) is a Horn formula\( ^6 \)
\( P \) postcondition: decides the satisfiability of \( \Phi \)

**begin function**

- \( \Phi \) contains a clause \( T \rightarrow \bot \) then return unsatisfiable
- else mark all atoms \( p \) where \( T \rightarrow p \) is a clause of \( \Phi \)

- while there is a Horn clause \( p_1 \land \cdots \land p_k \rightarrow q \) of \( \Phi \)
  such that all \( p_i \) are marked, but \( q \) isn’t do

- if \( q = \bot \) then return unsatisfiable
- else mark \( q \) for all Horn clauses of \( \Phi \)

end while

- return ‘satisfiable’

end function

**Theorem:** The HORN algorithm is correct: it always terminates and its answer is ‘satisfiable’ if the given Horn formula is satisfiable.
