## Midterm Examination 2 MA 3205: Set Theory

03.11.2009, 12.00-12.45h

Matriculation Number:	
-----------------------	--

## Rules

Each question contains as many marks as it has subquestion. Each correct subquestion gives 1 mark. The maximum score is 15 marks.

**Question 1.** Let (A, <) be a well-ordered set and  $B = \{f : A \to A\}$  be the set of all functions from A to A. Now define the following relation  $\square$  on  $f, g \in B$ :

$$f \sqsubset g \Leftrightarrow \exists a \in A \forall b \in A \, [f(a) < g(a) \wedge [b < a \Rightarrow f(b) = g(b)]].$$

- (a) What can be said about this ordering:
  - The relation is reflexive and thus not a partial ordering;
  - The relation is a partial ordering and has incomparable elements;
  - The relation is a linear ordering.
- (b) Give a justification for your answer.

<b>Question 2.</b> How many well-orderings exist on $A = \{0, 1, 2, 3\}$ ? Here call two well-orderings $<_1, <_2$ on a set $A$ are different iff there exist distinct $x, y \in A$ such that $x <_1 y$ and $y <_2 x$ .
(a) How many different well-orderings exist on $A = \{0, 1, 2, 3\}$ ?
(b) Give a justification for your answer.
Question 3. (a) Given two ordinals $\omega^{\alpha}$ and $\omega^{\beta}$ , which of the following conditions is equivalent to $\omega^{\alpha} + \omega^{\beta} = \omega^{\beta} + \omega^{\alpha}$ ? $\alpha < \beta;  \alpha \leq \beta;  \alpha = \beta;  \alpha \geq \beta;  \alpha > \beta;  \alpha \neq \beta$ .  (b) Give a justification for your answer.
Overtion 4. Which of the following statements about the reals are two always (for
<b>Question 4.</b> Which of the following statements about the rank are true always (for all sets $X$ ), sometimes (for some but not all sets $X$ ) and never (for no set $X$ )?
(a) If $\alpha = \rho(X)$ then $\alpha \subseteq X \subseteq V_{\alpha}$ : $\square$ always; $\square$ sometimes; $\square$ never.
(b) $\rho(\mathcal{P}(X)) = \rho(X) + 1$ : $\square$ always; $\square$ sometimes; $\square$ never.
(c) $\rho(X \times X) = \rho(X)$ where $X \times X = \{\{a, \{a, b\}\} : a, b \in X\}$ : $\square$ always; $\square$ sometimes; $\square$ never.

<b>Question 5.</b> (a) When is an ordinal $\alpha$ a cardinal?
$\square \alpha$ is a cardinal iff $\alpha$ is a limit ordinal;
$\alpha$ is a cardinal iff $\alpha \leq \omega$ or $\alpha$ is uncountable;
(b) Which of the following statements is true?
There is exactly one finite cardinal;
There is exactly one countable cardinal;
There is exactly one uncountable cardinal.
(c) For which cardinals $\kappa$ does $\kappa + \kappa = \kappa$ hold?
<b>Question 6.</b> Consider the partial ordering $\Box$ on three-tuples of integers by
$(u,v,w) \sqsubset (x,y,z) \Leftrightarrow u \leq x \land v \leq y \land w \leq z \land u+v+w < x+y+z.$
An element $(x, y, z)$ of a set A is called minimal iff there is no $(u, v, w) \in A$ with
$(u, v, w) \sqsubset (x, y, z)$ . Determine the number of minimal elements of the following sets;
this number can be any value in $\{0, 1, 2, \dots, \aleph_0\}$ .
(a) $A = \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z}$ :
(b) $B = \{(x, y, z) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} : x \ge 5 \land y \ge 5 \land z \ge 5 \land x + y + z \ge 16\}$ :
(c) $C = \{(x, y, z) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} : x \ge 5 \land y \ge 5 \land z \ge 5 \land x + y + z \ge 17\}$ :

## Working Space

You can use this page to do calculations, but you should write the answers into the space provided. Answers found here are not evaluated.
