NATIONAL UNIVERSITY OF SINGAPORE

SCHOOL OF COMPUTING EXAMINATION FOR Semester 2 AY 2013–2014 GEM1501 – PROBLEM SOLVING FOR COMPUTING

April/May 2014

Time Allowed 2 Hours

INSTRUCTIONS TO CANDIDATES

- 1. This examination paper consists of TEN (10) questions and comprises ELEVEN (11) printed pages, including this page.
- 2. Answer **ALL** questions within the space in this booklet.
- 3. This is a **Closed Book** examination.
- 4. Please write your Matriculation Number below:

MATRICULATION NO: _____

- 5. You may use calculators, provided that they do not contain any program or memory content.
- 6. Every question carries FIVE (5) marks and there are FIFTY (50) marks in total.

This portion is for examiner's use only

Qestion	Marks	Remarks	Qestion	Marks	Remarks
Q01:			Q06:		
Q02:			Q07:		
Q03:			Q08:		
Q04:			Q09:		
Q05:			Q10:		
			Total:		

Question 1 [5 marks]

GEM 1501

Explain what a punch card is and for which early machines (before 1900) it was used.

Question 2 [5 marks]

The following JavaScript program contains syntax and other programming errors in five of its lines. List them out below and explain what is wrong.

```
function calc(x)
                      // Line 1
  { array a; integer y,z; // Line 2
    z = calc(x);
                            // Line 3
    for (y=0;y<55555)
                               // Line 4
      \{ z = z+y; a[y] = z; \}
                                   // Line 5
        switch(z)
                                      // Line 6
                                        // Line 7
          { case 22: z = z+8; break;
                                            // Line 8
            case 24: z = z+y; break;
            case default: z = 22; break; } } // Line 9
     if (z < 3000) then { return(a); }
                                                  // Line 10
     a[0] = z; return(a); }
                                                     // Line 11
```

Question 3 [5 marks]

GEM 1501

Consider the following JavaScript program.

```
function f(a)
{ var n = a.length;
 var i; var j;
 var b = new Array(n);
 for (i=0;i<n;i++)
        { b[i] = 0;
        for (j=i;j<n;j++)
            { b[i] += a[j]; } }
    return(b); }</pre>
```

What is the time complexity of this program?

 $\Box \Theta(n) \qquad \Box \Theta(n \cdot \log(n)) \qquad \Box \Theta(n^2) \qquad \Box \Theta(n^2 \cdot \log(n))$

This program can be improved significantly. What is the time complexity of your improved program (it should be better than the above)?

 $\Box \Theta(\log(n)) \qquad \Box \Theta(n) \qquad \Box \Theta(n \cdot \log(n)) \qquad \Box \Theta(n^2)$

Write your program below.

Question 4 [5 marks]

Let $a \oplus b \oplus c$ be 1 if and only if an odd number of the input variables a, b, c have the value 1 (and similarly for other numbers of inputs). Furthermore, let $a \wedge b$ be 1 if and only if both inputs a and b are 1. Now consider

$$F(a, b, c, d) = (a \land b) \oplus (a \land c) \oplus (a \land d) \oplus (b \land c) \oplus (b \land d) \oplus (c \land d).$$

Describe in words when F(a, b, c, d) is 1 and when it is 0. Furthermore, how many of the binary vectors (a, b, c, d) are mapped to 1?

Question 5 [5 marks]

Describe the following three machines / automata and point out the differences between them:

- a finite automaton;
- a linear bounded Turing machine (also known as linear bounded automaton);
- a Turing machine (without resource bound constraints).

Question 6 [5 marks]

The Roman general and politician Gaius Julius Caesar used a cryptographic method to encrypt and decrypt texts. Explain the method and also its vulnerabilities: In particular, utilise the knowledge that "L" is a very frequent letter to decrypt the message "DAHHK SKNHZ!"; give the full value of the message; note that spaces and punctuation marks are not encrypted.

Question 7 [5 marks]

Write a function **sort(a)** with the following properties:

- The input **a** is a dynamical array (with some indices used and others not);
- The output **b** is an empty array at the beginning and should contain the elements of **a** in sorted order after the end of the function.

For example, if a[5] is 12, a[8] is 11 and a[17] is 22 and no other elements of a exist, then the function should define the array elements b[0] to be 11, b[1] to be 12 and b[2] to be 22.

function sort(a)
{ b = new Array();

return(b); }

Question 8 [5 marks]

GEM 1501

Make a deterministic finite automaton using the alphabet $\Sigma = \{0, 1, 2\}$ such that the automaton accepts a word w if and only if the word contains exactly two times a 1 and exactly one time a 2.

Question 9 [5 marks]

GEM 1501

The following regular expression

 $30^* \mid 20^*10^* \mid 10^*20^* \mid 10^*10^*10^*$

describes a set of decimal numbers. Give a description of this set in words and list all elements of length one or two. For example, 10^* describes the set of all powers of 10 and the elements up to length five are 1 (one), 10 (ten), 100 (hundred), 1000 (one thousand) and 10000 (ten thousand).

Question 10 [5 marks]

A solution of a set of clauses is a truth-assignment to the logical variables such that each clause is satisfied by the given assignment. The satisfiability problem asks whether for a given set of clauses there is at least one truth-assignment making all clauses true. Consider the following set of clauses:

- $x_1 \lor x_2 \lor x_3 \lor x_5;$
- $\neg x_1 \lor x_4;$
- $\neg x_2 \lor x_4;$
- $\neg x_3 \lor x_4;$
- $\neg x_4 \lor \neg x_5;$
- $x_5 \lor x_6 \lor x_7;$
- $x_5 \vee \neg x_6;$
- $x_5 \vee \neg x_7$.

How many solutions does this set of clauses have?

 $\Box 0 \Box 1 \Box 2 \Box 3 \Box 4 \Box 5 \Box 6 \Box 7 \text{ or more.}$

Write a few lines on how you determined the number of solutions.
