Subject: looking for new postdoc

hi, Limsoon,

happy New Year and happy Chinese Lunar New Year!

i like to bring to your attention that i have two postdoc positions open in the area of computational biology and genomics. i am particularly interested in young researchers who have research experience in this area. but this will also be a good opportunity for someone who has background in machine learning and data mining and likes to get into the research area of computational biology and genomics. in the past several year, my lab has been focusing on developing and applying machine learning/datamining methods for some fundamental biology problems, such as transcriptional and post-transcriptional gene regulation, and some medical problems, such as understanding stress response in plants and complex human diseases including Alzheimer's disease. some information of the work we are doing can be found on my homepage.

if you have any graduating Ph.D. students or know someone who might be interested in this opening, please send them my way.

thanks!

best regards,

--
