CS2220: Introduction to Computational Biology

Lecture 7: Sequence Homology Interpretation

Limsoon Wong

3 March 2006

Plan

- **Recap of sequence alignment**
- **Guilt by association**
- **Active site/domain discovery**
- **What if no homology of known function is found?**
  - Genome phylogenetic profiling
  - Protfun
  - SVM-Pairwise
  - Protein-protein interactions
- **Key mutation site discovery**

Very Brief Recap of Sequence Comparison/Alignment

Motivations for Sequence Comparison

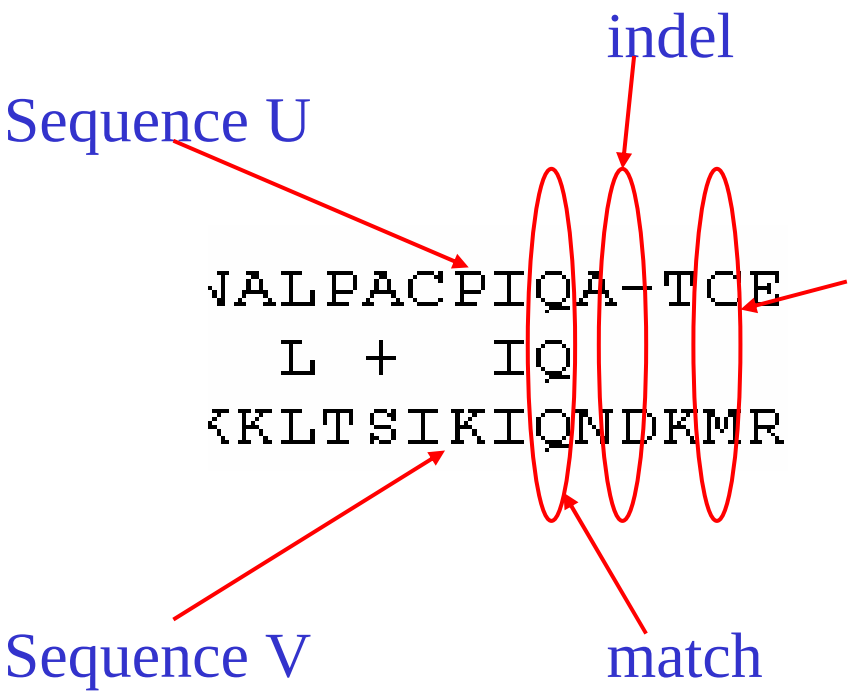
- **DNA is blue print for living organisms**

$\Rightarrow$ **Evolution is related to changes in DNA**

$\Rightarrow$ **By comparing DNA sequences we can infer evolutionary relationships between the sequences w/o knowledge of the evolutionary events themselves**

- **Foundation for inferring function, active site, and key mutations**

Sequence Alignment



- **Key aspect of seq comparison is seq alignment**
- **A seq alignment maximizes the number of positions that are in agreement in two sequences**

Sequence Alignment: Poor Example

- **Poor seq alignment shows few matched positions**

$\Rightarrow$ **The two proteins are not likely to be homologous**

Alignment by FASTA of the sequences of amicyanin and domain 1 of ascorbate oxidase

```
                          60         70         80         90         100
Amicyanin          MPHNVHFVAGVLGEAALKGPMMKKEQAYSLTFTEAGTYDYHCTPHPFMRGKVVVE
                                                :..:   . ::. ::
Ascorbate Oxidase ILQRGTPWADGTASISQCAINPGETFFYNFTVDNPGTFFYHGHLGMQRSAGLYGSLI
                        70         80         90         100        110        120
```

No obvious match between
Amicyanin and Ascorbate Oxidase

Sequence Alignment: Good Example

- **Good alignment usually has clusters of extensive matched positions**

$\Rightarrow$ **The two proteins are likely to be homologous**

```
>gi|13476732|ref|NP_108301.1|   unknown protein [Mesorhizobium loti]
gi|14027493|dbj|BAB53762.1|   unknown protein [Mesorhizobium loti]
          Length = 105

 Score =  105 bits (262), Expect = 1e-22
 Identities = 61/106 (57%), Positives = 73/106 (68%), Gaps = 1/106 (0%)

```

good match between
Amicyanin and unknown M. loti protein

Multiple Alignment: An Example

- **Multiple seq alignment maximizes number of positions in agreement across several seqs**
- **seqs belonging to same "family" usually have more conserved positions in a multiple seq alignment**

```

```

Conserved sites

Application of Sequence Comparison: Guilt-by-Association

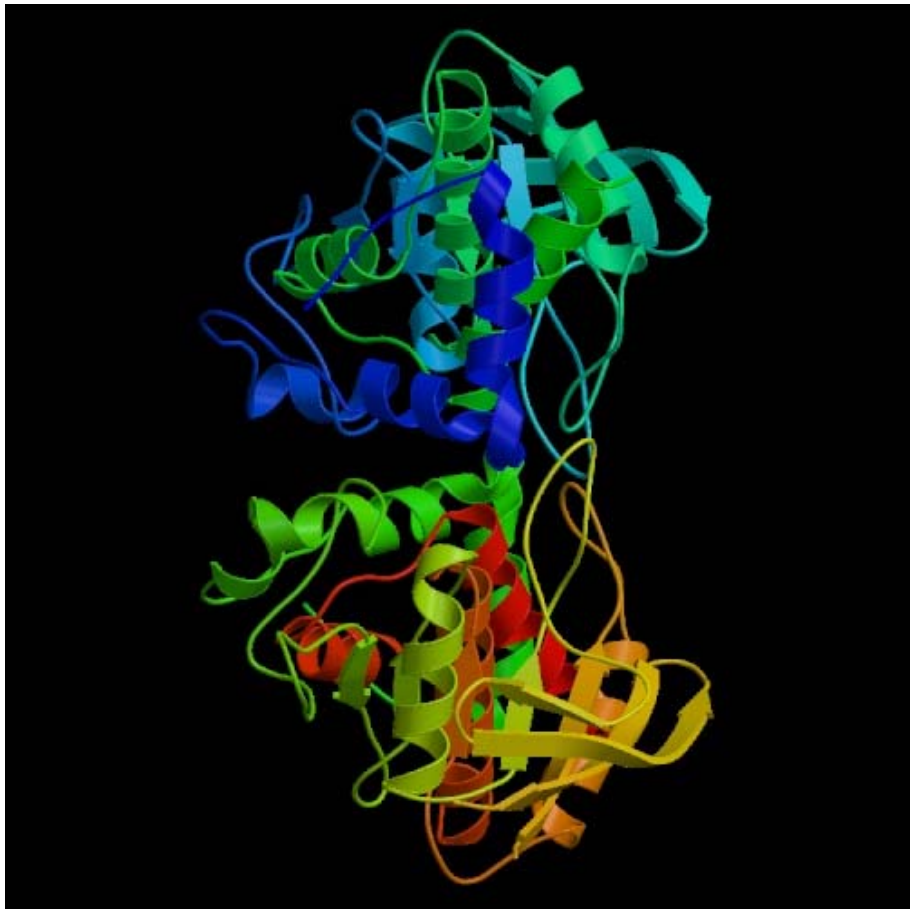
Emerging Patterns

- **An emerging pattern is a pattern that occurs significantly more frequently in one class of data compared to other classes of data**

- **A lot of biological sequence analysis problems can be thought of as extracting emerging patterns from sequence comparison results**

A protein is a ...

- **A protein is a large complex molecule made up of one or more chains of amino acids**
- **Protein performs a wide variety of activities in the cell**



Function Assignment to Protein Sequence

**SPSTNRKYPPLPVDKLEEEINRRMADDNKLFREEFNALPACPIQATCEAASKEENKEKNR
YVNILPYDHSRVHLTPVEGVPDSDYINASFINGYQEKNKFIAAQGPKEETVNDFWRMIWE

TFVVIDAMLDMMHSERKVDVYGFVSRIRAQRCQMVQTDMQYVFIYQALLEHYLYGDTELE
VT**

- **How do we attempt to assign a function to a new protein sequence?**

Guilt-by-Association

- Compare the target sequence T with sequences S_1, …, S_n of known function in a database
- Determine which ones amongst S_1, …, S_n are the mostly likely homologs of T
- Then assign to T the same function as these homologs
- Finally, confirm with suitable wet experiments

Guilt-by-Association

Compare *T* with seqs of known function in a db

Good Sequence Alignment

- Good alignment usually has clusters of extensive matched positions

⇒ The two proteins are likely to be homologous

```
>gi|134767321|ref|NP_108301.1|  unknown protein [Mesorhizobium loti]
gi|14027493|dbj|BAB53762.1|  unknown protein [Mesorhizobium loti]
          Length = 105

 Score =  105 bits (262), Expect = 1e-22
 Identities = 61/106 (57%), Positives = 73/106 (68%), Gaps = 1/106 (0%)

                      70        80        90        100       110
```

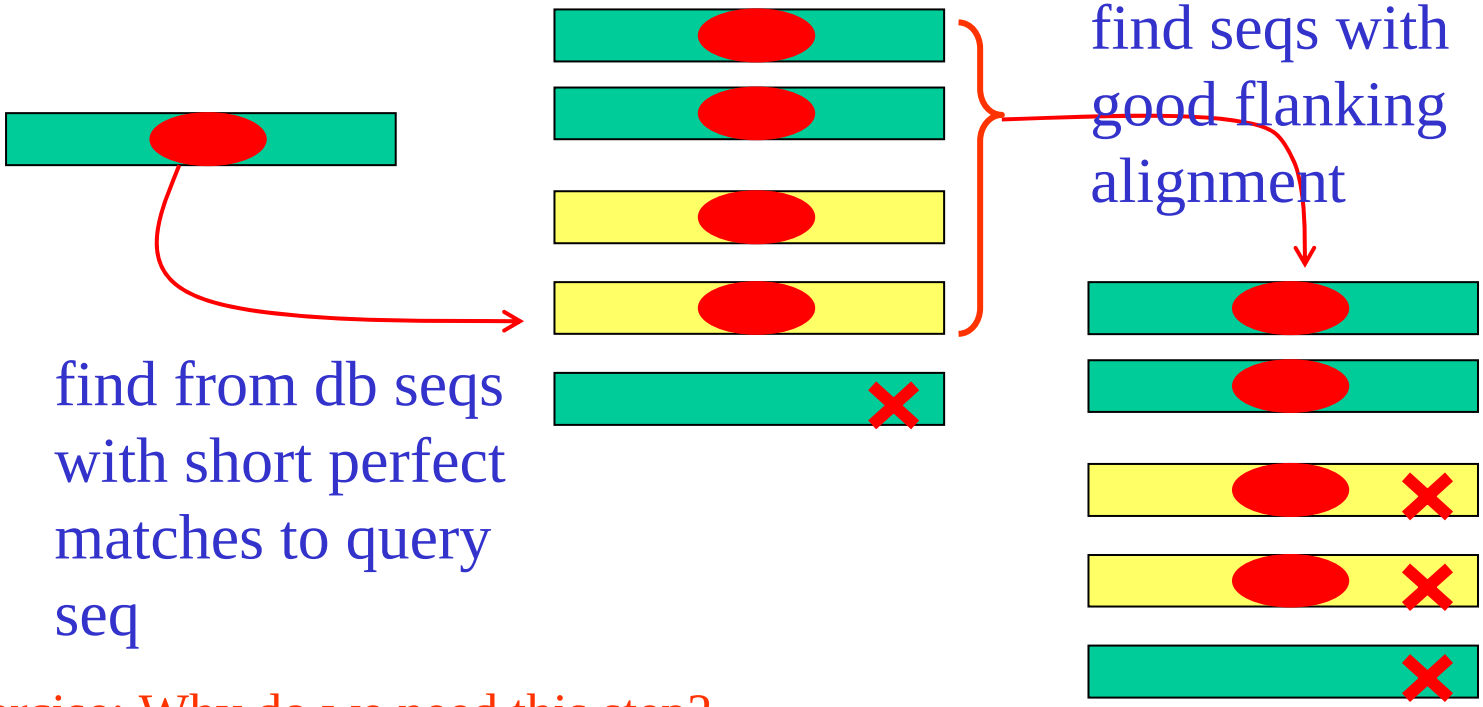
No obvious match between Amicyanin and Ascorbate Oxidase

Discard this function as a candidate

BLAST: How It Works

Altschul et al., *JMB*, 215:403--410, 1990

- **BLAST is one of the most popular tool for doing "guilt-by-association" sequence homology search**



Exercise: Why do we need this step?

Homologs obtained by BLAST

Sequences producing significant alignments:	Score (bits)	E Value

```

Guilt-by-Association: Caveats

- **Ensure that the effect of database size has been accounted for**
- **Ensure that the function of the homology is not derived via invalid "transitive assignment"**
- **Ensure that the target sequence has all the key features associated with the function, e.g., active site and/or domain**

Interpretation of P-value

- Seq. comparison progs, e.g. BLAST, often associate a P-value to each hit
- P-value is interpreted as prob that a random seq has an equally good alignment

- Suppose the P-value of an alignment is 10^{-6}
- If database has 10^7 seqs, then you expect $10^7 * 10^{-6} = 10$ seqs in it that give an equally good alignment

$\Rightarrow$ Need to correct for database size if your seq comparison prog does not do that!

Exercise: Name a commonly used method for correcting p-value for a situation like this

Examples of Invalid Function Assignment:

The IMP Dehydrogenases (IMPDH)

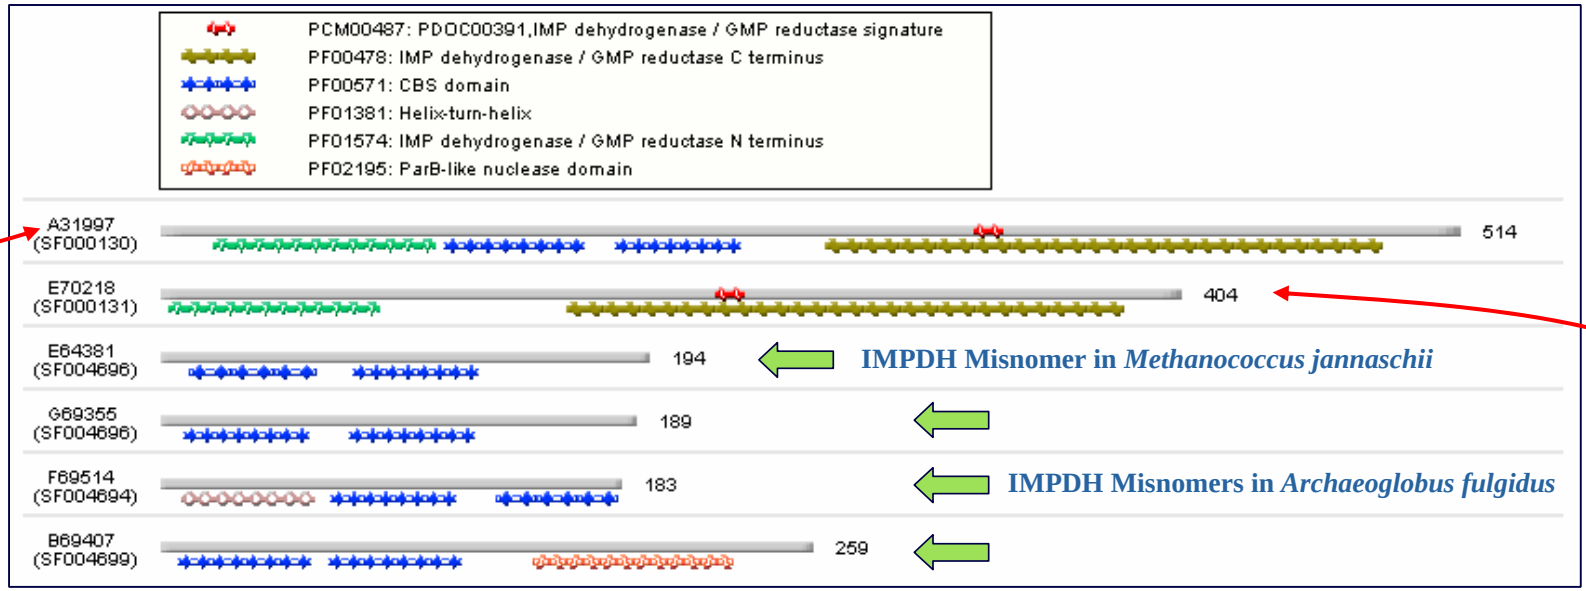
A partial list of IMPdehydrogenase misnomers in complete genomes remaining in some public databases

IMPDH Domain Structure



- **Typical IMPDHs have 2 IMPDH domains that form the catalytic core and 2 CBS domains.**
- **A less common but functional IMPDH (E70218) lacks the CBS domains.**
- **Misnomers show similarity to the CBS domains**

Invalid Transitive Assignment

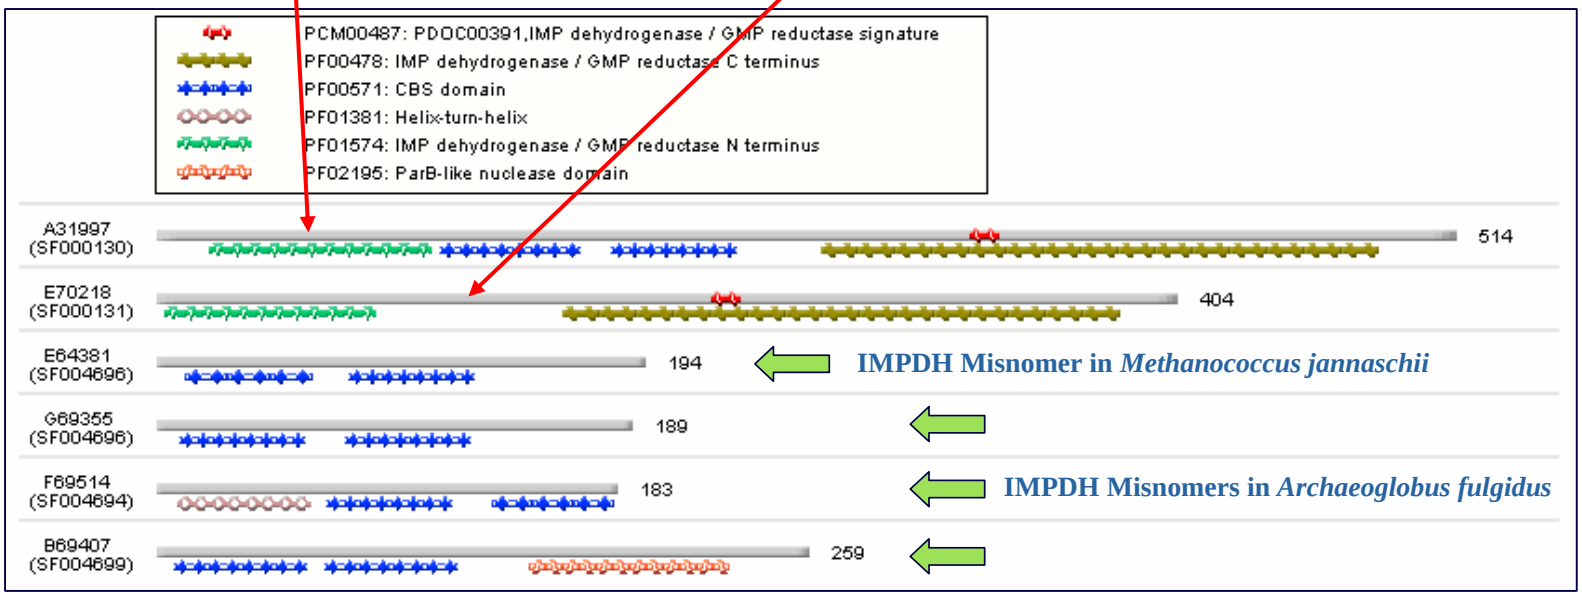
Mis-assignment of function

No IMPDH domain

Emerging Pattern

Typical IMPDH

Functional IMPDH w/o CBS



- **Most IMPDHs have 2 IMPDH and 2 CBS domains**
- **Some IMPDH (E70218) lacks CBS domains**

⇒ **IMPDH domain is the emerging pattern**

Application of Sequence Comparison: Active Site/Domain Discovery

Discover Active Site and/or Domain

- **How to discover the active site and/or domain of a function in the first place?**
  - Multiple alignment of homologous seqs
  - Determine conserved positions

  $\Rightarrow$ Emerging patterns relative to background

  $\Rightarrow$ Candidate active sites and/or domains

- **Easier if sequences of distance homologs are used**

Exercise: Why?

Multiple Alignment of PTPs

```
gi|126467|      FHFTSWPDFGVPFTPIGMLKFLKKVKACNP--QYAGAIVVHCSAGVGRTGTFVVIDAMLD

```

- **Notice the PTPs agree with each other on some positions more than other positions**
- **These positions are more impt wrt PTPs**
- **Else they wouldn't be conserved by evolution**

$\Rightarrow$ **They are candidate active sites**

Guilt-by-Association: What if no homolog of known function is found?

genome phylogenetic profiles

protfun's feature profiles

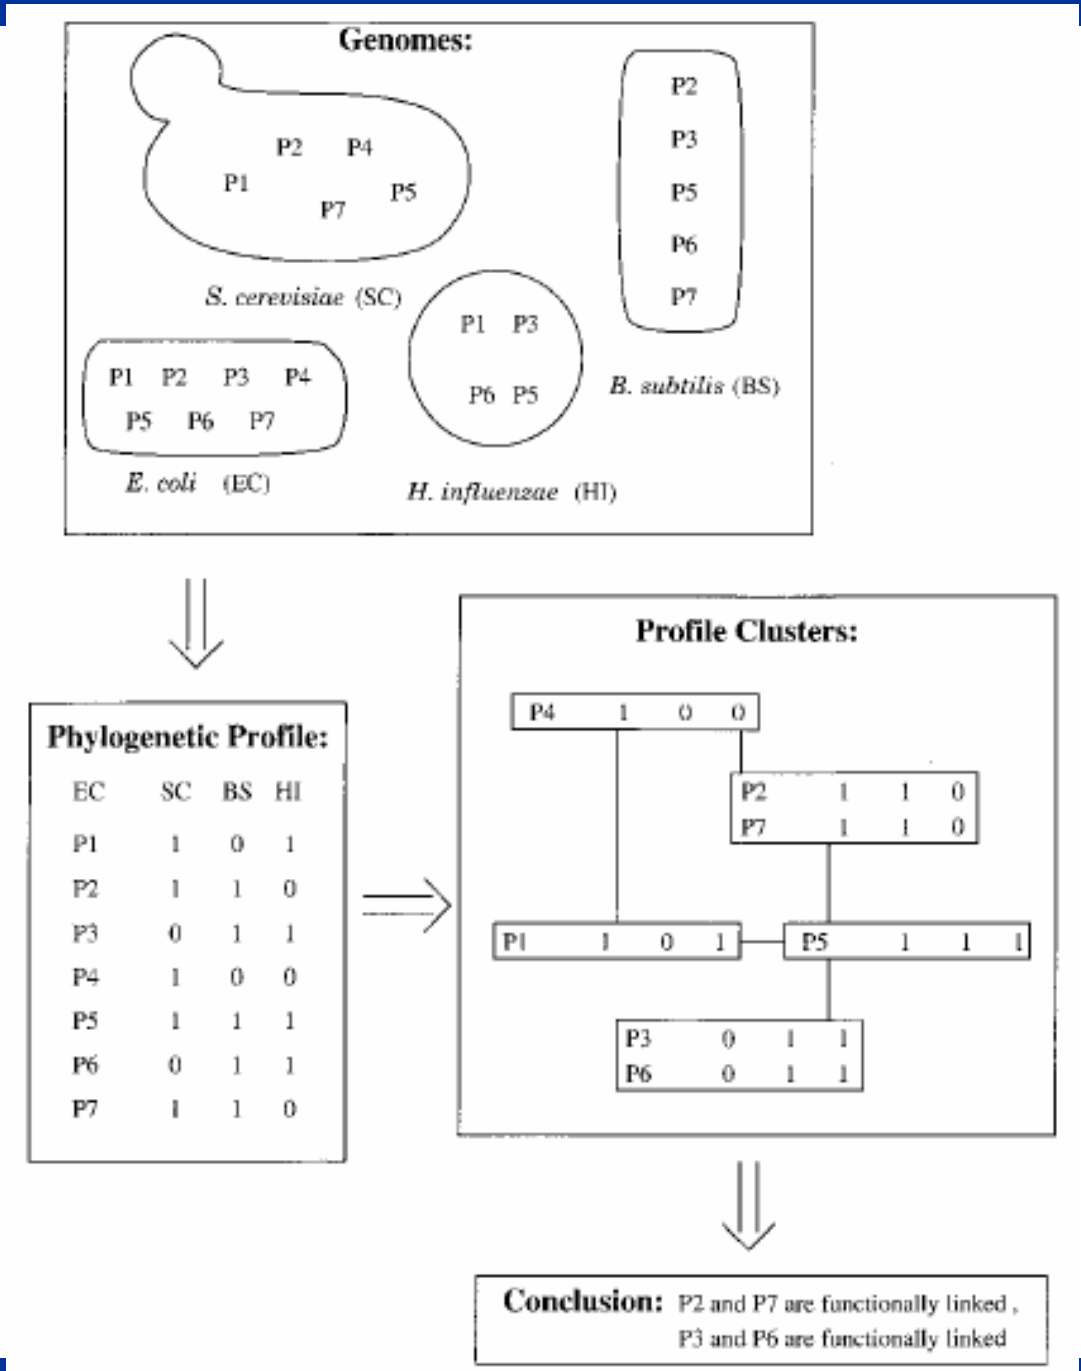
Phylogenetic Profiling

Pellegrini et al., *PNAS*, 96:4285--4288, 1999

- **Gene (and hence proteins) with identical patterns of occurrence across phyla tend to function together**

$\Rightarrow$ **Even if no homolog with known function is available, it is still possible to infer function of a protein**

Phylogenetic Profiling: How it Works



Phylogenetic Profiling: P-value

The probability of observing by chance z occurrences of genes X and Y in a set of N lineages, given that X occurs in x lineages and Y in y lineages is

$$P(z|N,x,y) = \frac{w_z * \overline{w_z}}{W}$$

where

$$w_z = \binom{N}{z}$$

$$\overline{w_z} = \binom{N-z}{x-z} * \binom{N-z}{y-z}$$

$$W = \binom{N}{x} * \binom{N}{y}$$

No. of ways to distribute *z* co-occurrences over *N* lineage's

No. of ways to distribute the remaining *x* – *z* and *y* – *z* occurrences over the remaining *N* – *z* lineage's

No. of ways of distributing *X* and *Y* over *N* lineage's without restriction

Phylogenetic Profiles: Evidence

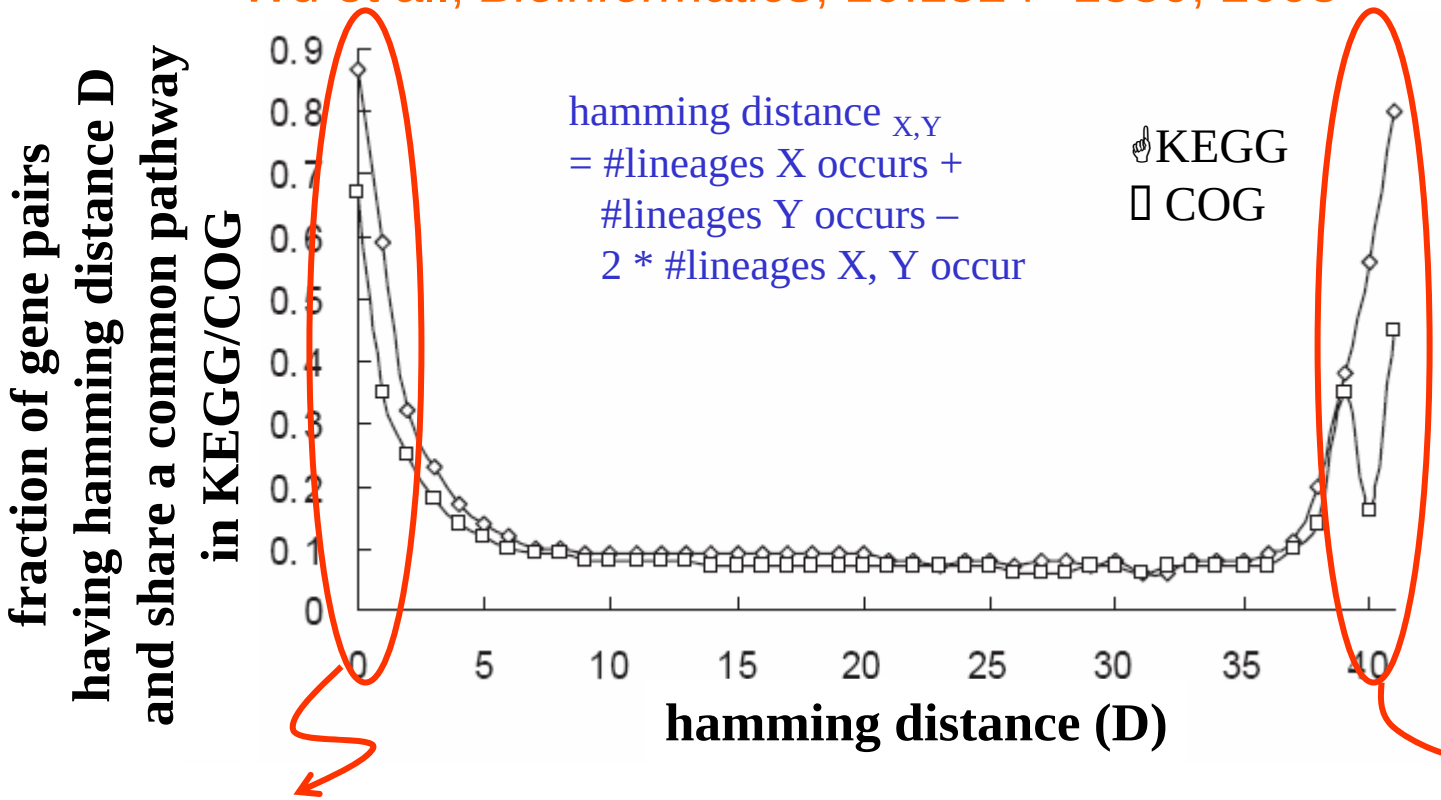
Pellegrini et al., *PNAS*, 96:4285--4288, 1999

Keyword	**No. of non-homologous proteins in group**	No. neighbors in keyword group	No. neighbors in random group
Ribosome	60	197	27
Transcription	36	17	10
tRNA synthase and ligase	26	11	5
Membrane proteins*	25	89	5
Flagellar	21	89	3
Iron, ferric, and ferritin	19	31	2
Galactose metabolism	18	31	2
Molybdoterin and Molybdenum, and molybdoterin	12	6	1
Hypothetical†	1,084	108,226	8,440

- **E. coli proteins grouped based on similar keywords in SWISS-PROT have similar phylogenetic profiles**

Phylogenetic Profiling: Evidence

Wu et al., *Bioinformatics*, 19:1524--1530, 2003



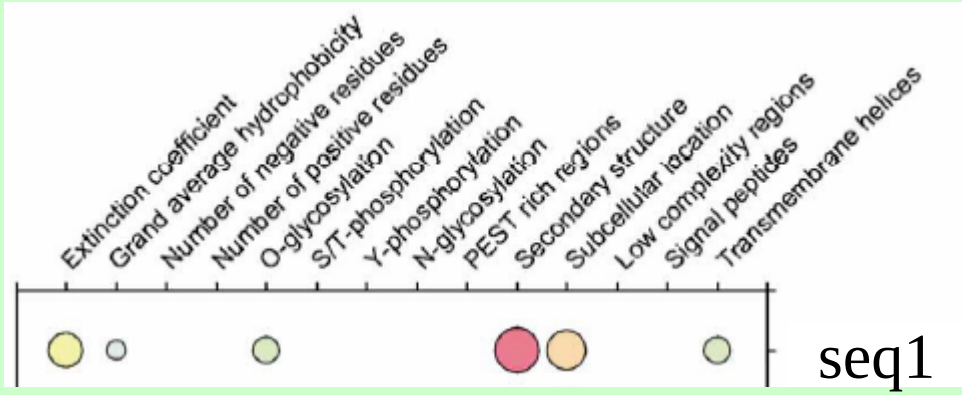
- **Proteins having low hamming distance (thus highly similar phylogenetic profiles) tend to share common pathways**

Exercise: Why do proteins having high hamming distance also have this behaviour?

The ProtFun Approach

Jensen, *JMB*, 319:1257--1265, 2002

- **A protein is not alone when performing its biological function**
- **It operates using the same cellular machinery for modification and sorting as all other proteins do, such as glycosylation, phospharylation, signal peptide cleavage, …**
- **These have associated consensus motifs, patterns, etc.**



- **Proteins performing similar functions should share some such "features"**

⇒ **Perhaps we can predict protein function by comparing its "feature" profile with other proteins?**

ProtFun: How it Works

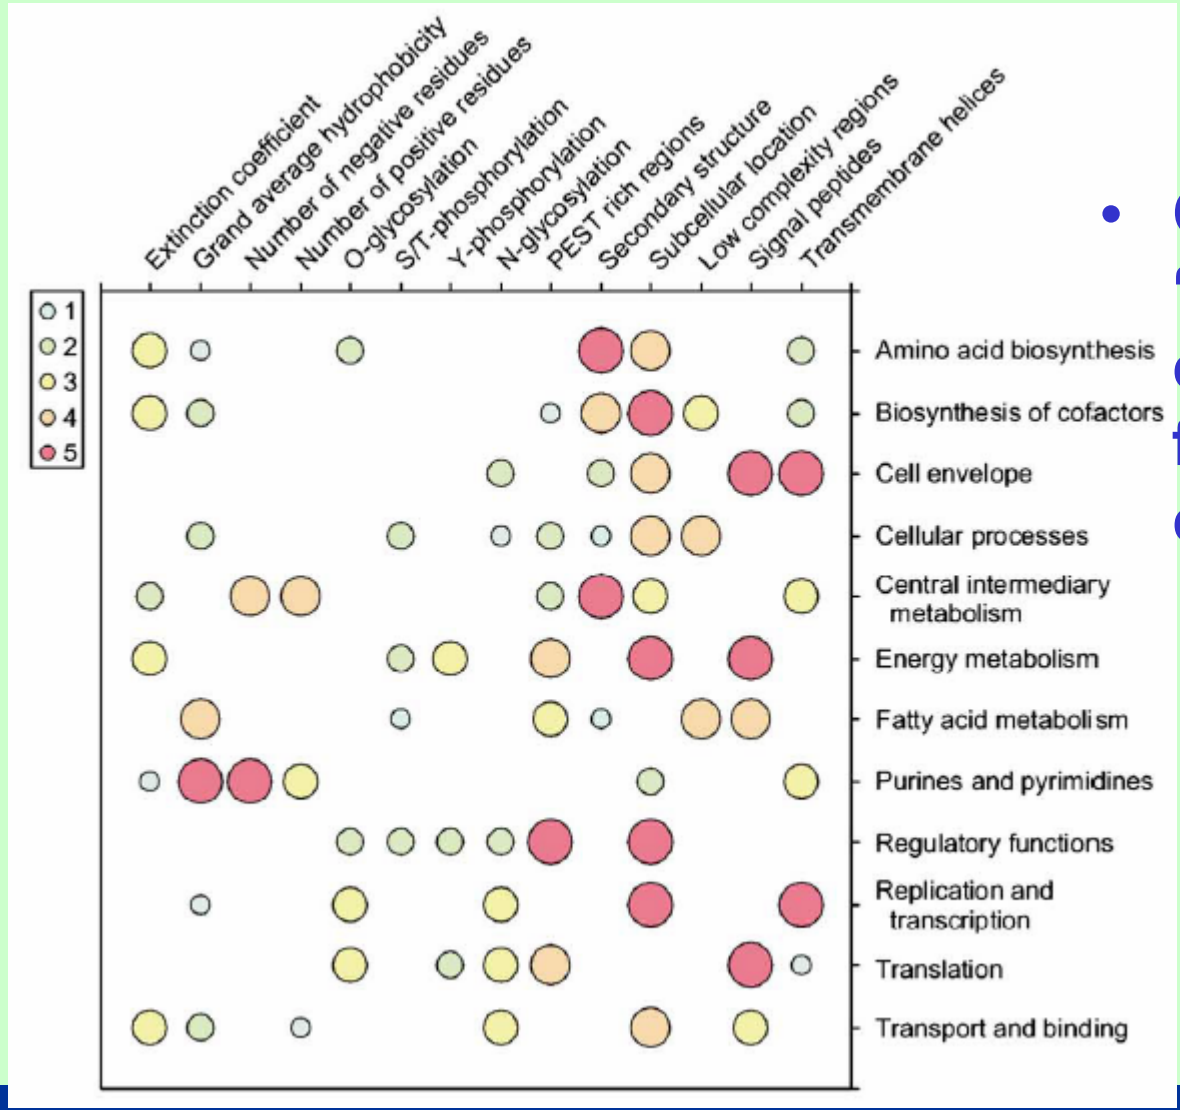
Abbriviation	Encoding	Description
ec	single value	Extinction coefficient predicted by ExPASy ProtParam
gravy	single value	Hydrophobicity predicted by ExPASy ProtParam
nneg	single value	Number of negatively charged residues counted by ExPASy ProtParam
npos	single value	Number of positively charged residues counted by ExPASy ProtParam
nglyc	potential in 5 bins	N-glycosylation sites predicted by NetNGlyc
oglyc	potential-threshold in 10 bins	GalNAc O-glycosylations predicted by NetOGlyc
pest	fraction in 10 bins	PEST rich regions identified by PESTfind
phosST	potential in 10 bins	Serine and threonine phosporylations predicted by NetPhos
phosY	potential in 10 bins	Tyrosine phosporylations predicted by NetPhos
psipred	helix, sheet, coil in 5 bins	Predicted secondary structure from PSI-Pred
psort	20 probabilities	Subcellular location predtions by PSORT
seg	fraction in 10 bins	Low-complexity regions identified by SEG
signalp	meanS, maxY, log(cleavage pos)	Signal peptide predictions made by SignalP
tmhmm	inside, outside, membrane in 5 bins	Transmembrane helix predictions made by TMHMM

Extract feature profile of protein using various prediction methods

Category	Hidden units	Input features
Amino acid biosynthesis	30	ec psipred psort tmhmm
	30	ec psipred tmhmm
	30	ec netoglyc psipred psort
	30	gravy psipred psort
	30	oglyc psipred psort

Average the output of the 5 component ANNs

ProtFun: Evidence



- **Combinations of "features" seem to characterize some functional categories**

ProtFun: Example Output

	Prion	A4	TTHY
Amino acid biosynthesis	0.011	0.011	0.011
Biosynthesis of cofactors	0.041	0.161	0.034
Cell envelope	0.146	0.804	0.698

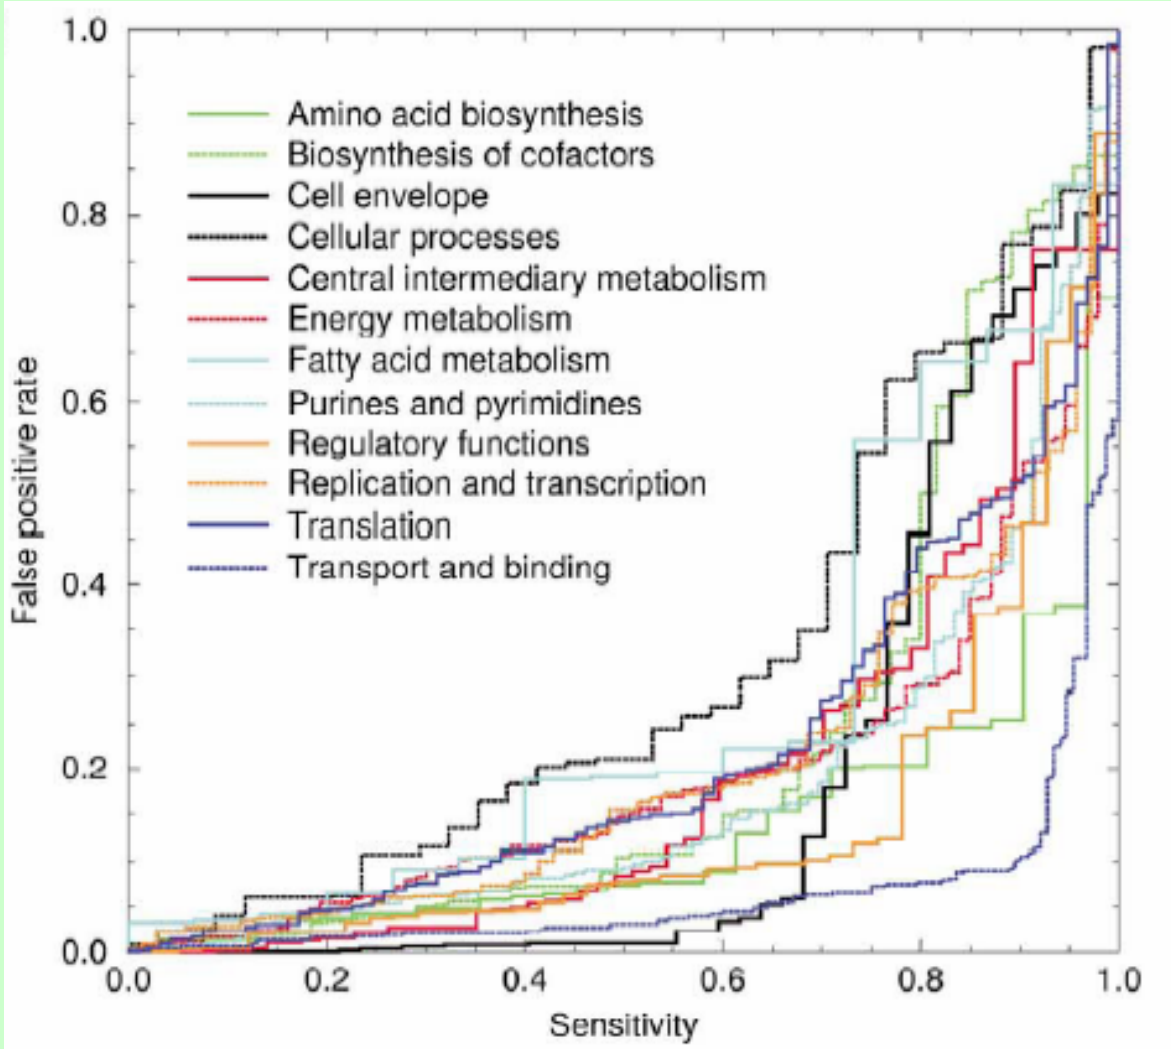
- **At the seq level, Prion, A4, & TTHY are dissimilar**
- **ProtFun predicts them to be cell envelope-related, tranport & binding**
- **This is in agreement w/ known functionality of these proteins**

ProtFun: Performance



SVM-Pairwise Framework

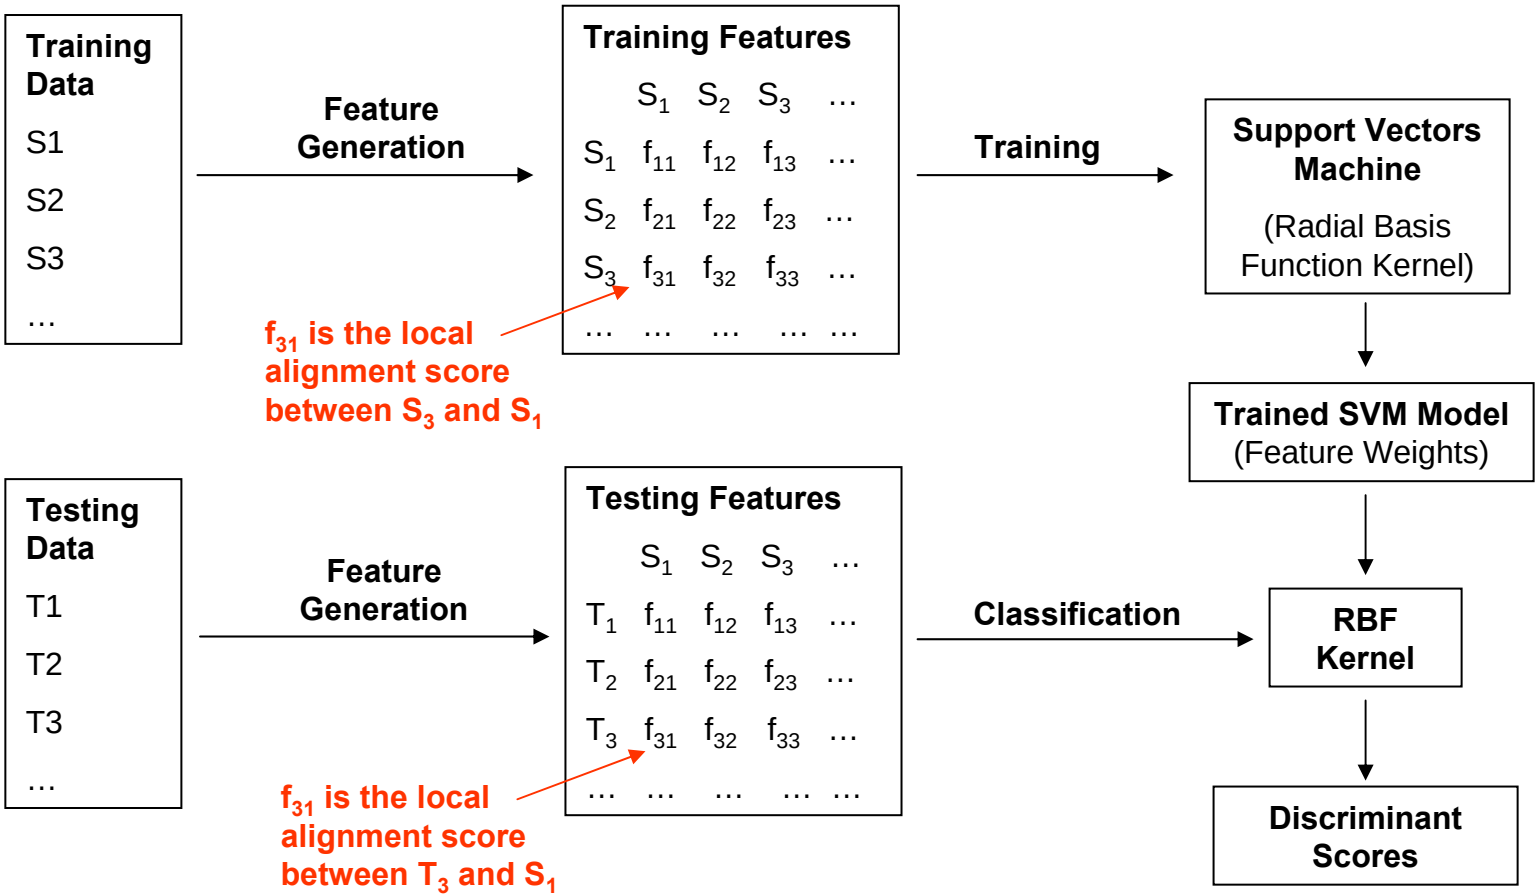


Image credit: Kenny Chua

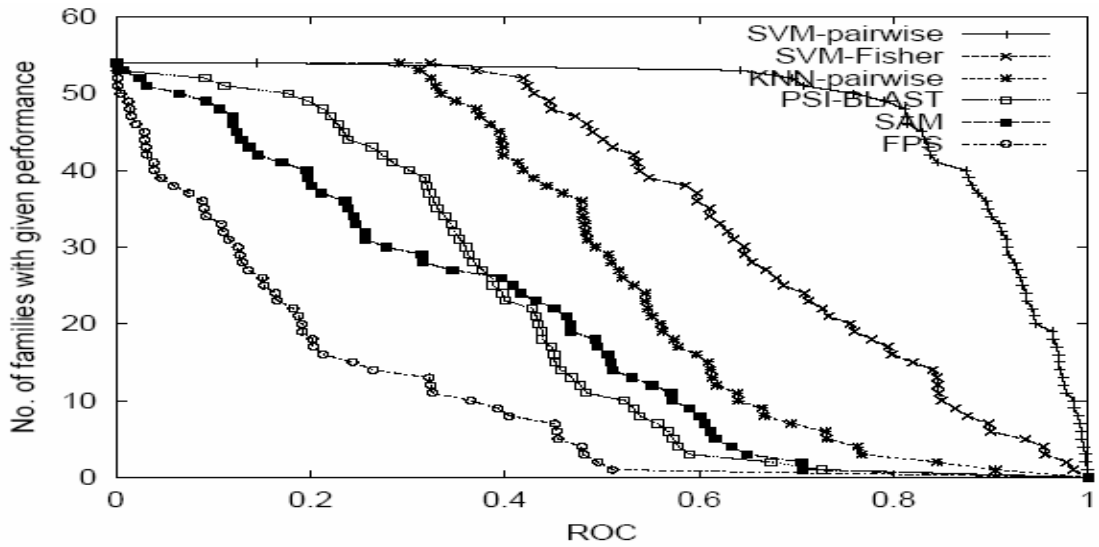
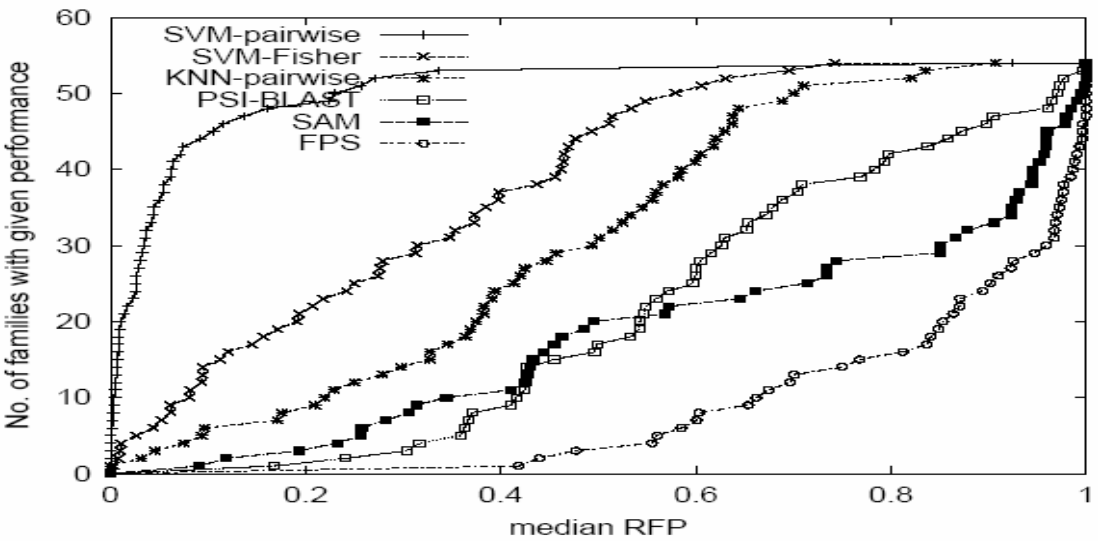
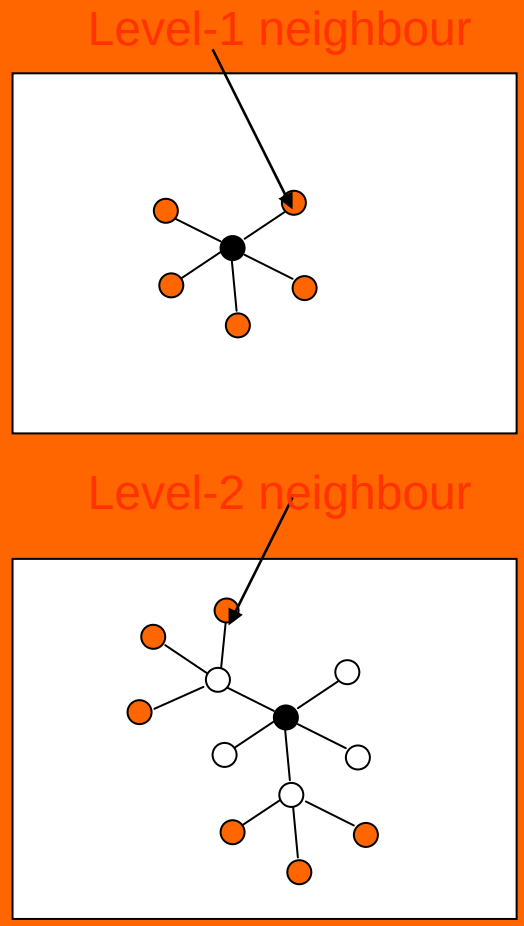
Performance of SVM-Pairwise

- **Receiver Operating Characteristic (ROC)**
  - The area under the curve derived from plotting true positives as a function of false positives for various thresholds.
- **Rate of median False Positives (RFP)**
  - The fraction of negative test examples with a score better or equals to the median of the scores of positive test examples.



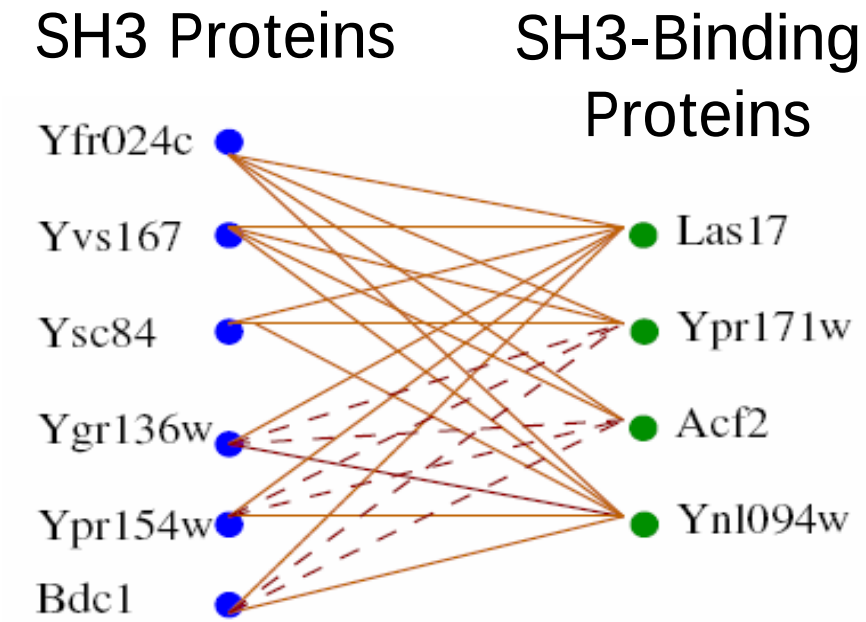


Protein Function Prediction from Protein Interactions



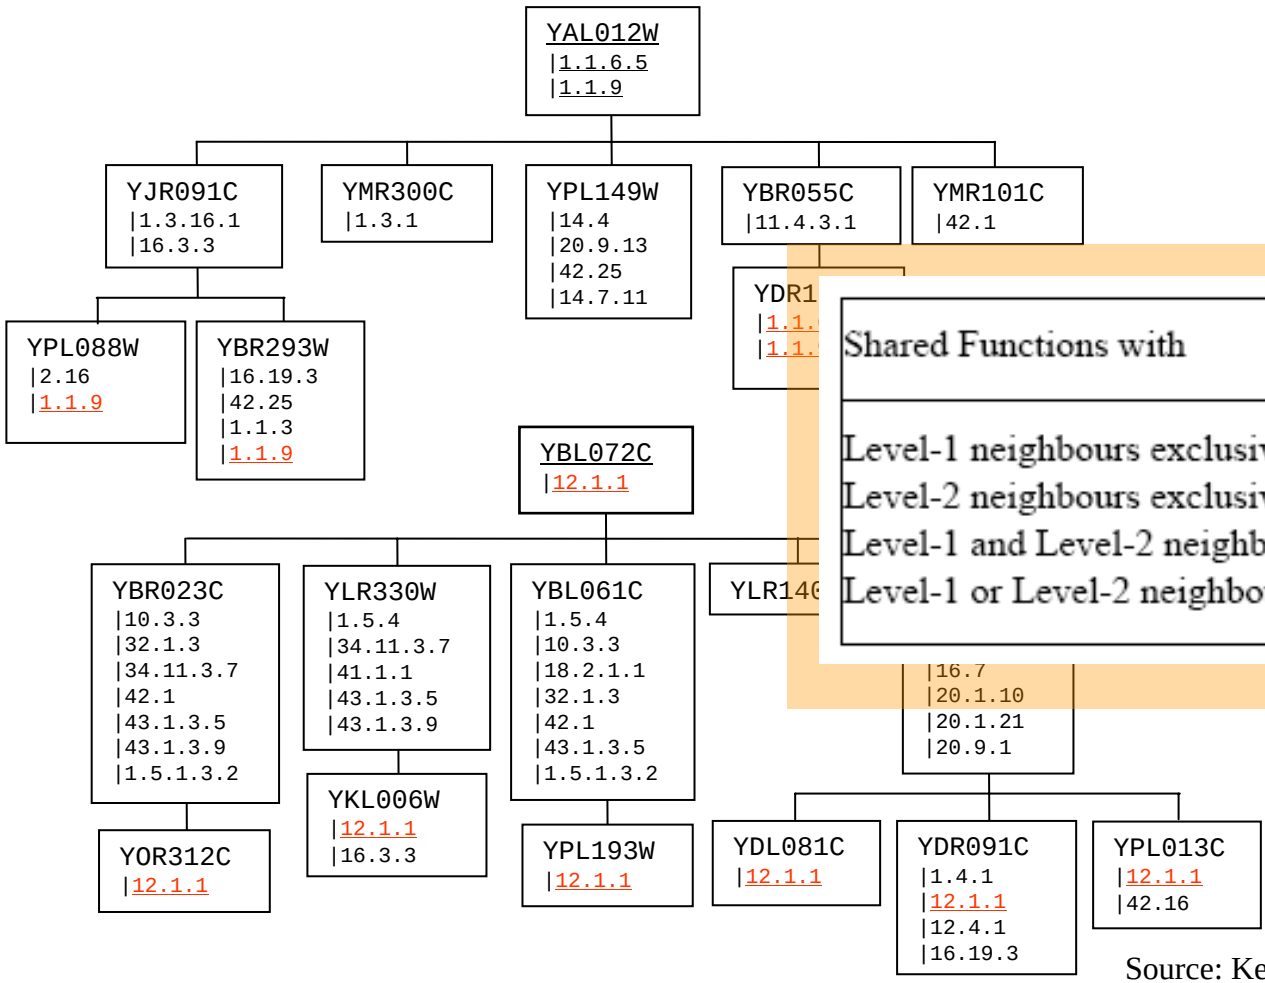
NUS National University of Singapore

An illustrative Case of Indirect Functional Association?



- **Is indirect functional association plausible?**
- **Is it found often in real interaction data?**
- **Can it be used to improve protein function prediction from protein interaction data?**

Freq of Indirect Functional Association



Shared Functions with	Fraction
Level-1 neighbours exclusively	0.016338
Level-2 neighbours exclusively	0.226574
Level-1 and Level-2 neighbours	0.463960
Level-1 or Level-2 neighbours	0.706872

Source: Kenny Chua

Over-Rep of Functions in Neighbours

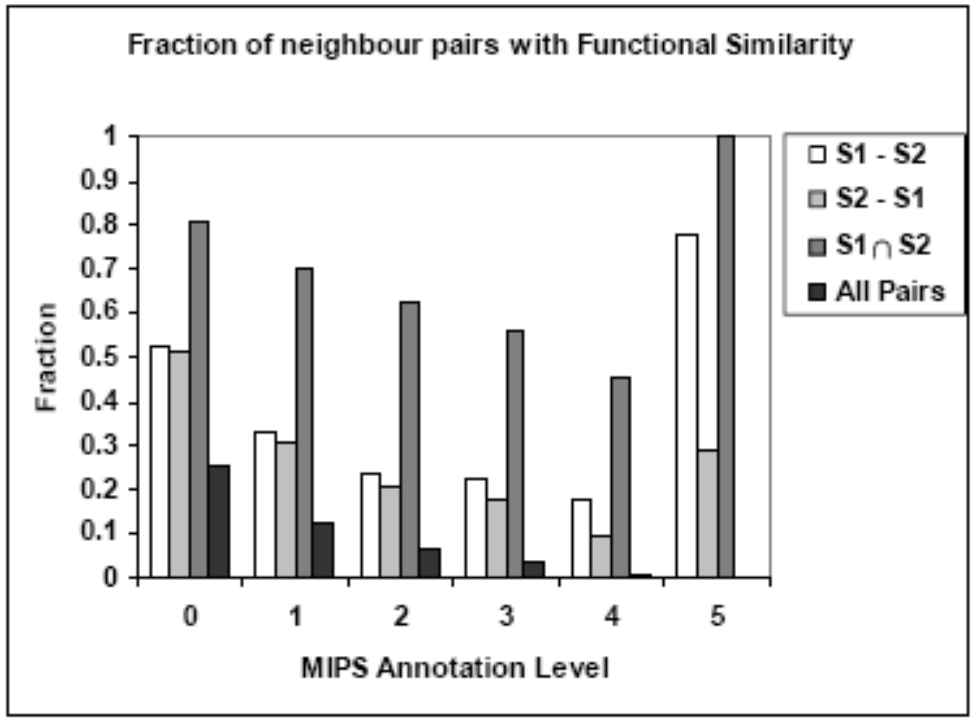
- **Functional Similarity:**

$$S(i,j) = \frac{|F_i \cap F_j|}{|F_i \cup F_j|}$$

  - where F_k is the set of functions of protein k

- **L1 ∩ L2 neighbours show greatest over-rep**

- **L3 neighbours show little observable over-rep**



Source: Kenny Chua

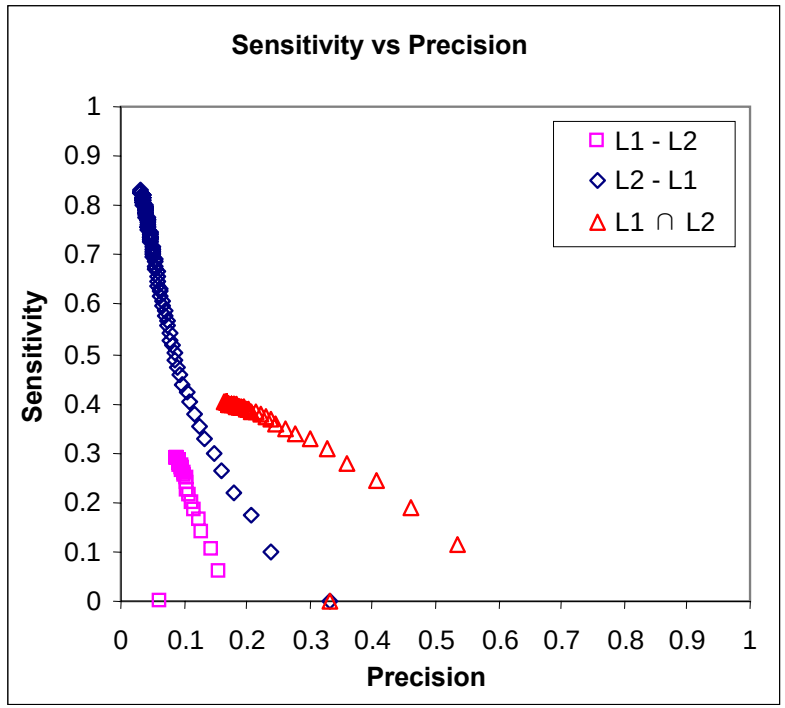
Prediction Power By Majority Voting

Source: Kenny Chua

- **Remove overlaps in level-1 and level-2 neighbours to study predictive power of "level-1 only" and "level-2 only" neighbours**
- **Sensitivity vs Precision analysis**

$$PR = \frac{\sum_i^K k_i}{\sum_i^K m_i} \qquad SN = \frac{\sum_i^K k_i}{\sum_i^K n_i}$$

  - n_i is no. of fn of protein i
  - m_i is no. of fn predicted for protein i
  - k_i is no. of fn predicted correctly for protein i



⇒ **"level-2 only" neighbours performs better**

⇒ **L1 ∩ L2 neighbours has greatest prediction power**

Use L1 & L2 Neighbours for Prediction

- **Weighted Average**
  - Over-rep of functions in L1 and L2 neighbours
  - Each observation of L1 or L2 neighbour is summed

$$f_x(u) = \frac{1}{Z}\left[\lambda r_{\text{int}}\pi_x + \sum_{v\in N_u}\left(S_{TR}(u,v)\delta(v,x) + \sum_{w\in N_v} S_{TR}(u,w)\delta(w,x)\right)\right]$$

- **$S_{TR}(u,v)$ is an "index" for function xfer betw u and v,**
- **$\delta(k, x) = 1$ if k has function x, 0 otherwise**
- **N_k is the set of interacting partners of k**
- **π_x is freq of function x in the dataset**
- **λ is contribution of background freq to the score**
- **r_{int} is fraction of all interaction pairs that share some functions**

$$Z = 1 + \sum_{v\in N_u}\left(S_{TR}(u,v) + \sum_{w\in N_v} S_{TR}(u,w)\right)$$

Source: Kenny Chua

Functional Similarity Estimate: Czekanowski-Dice Distance

- **Functional distance between two proteins** (Brun et al, 2003)

$$D(u,v) = \frac{\left|N_u \Delta N_v\right|}{\left|N_u \cup N_v\right| + \left|N_u \cap N_v\right|}$$

  - **N_k is the set of interacting partners of k**
  - **X Δ Y is symmetric diff betw two sets X and Y**
  - **Greater weight given to similarity**

$\Rightarrow$ Similarity can be defined as

$$S(u,v) = \frac{2X}{2X + (Y+Z)}$$

Is this a good measure if u and v have very diff number of neighbours?

Source: Kenny Chua

Functional Similarity Estimate: Modified Equiv Measure

- **Modified Equivalence measure**

$$S(u,v)=\frac{2|N_u \cap N_v|}{|N_u - N_v|+2|N_u \cap N_v|}\times\frac{2|N_u \cap N_v|}{|N_v - N_u|+2|N_u \cap N_v|}$$

  - **N_k is the set of interacting partners of k**
  - **Greater weight given to similarity**

$\Rightarrow$ Rewriting this as

Exercise: What else should we consider in this formula?

$$S(u,v)=\frac{2X}{2X+Y}\times\frac{2X}{2X+Z}$$

Source: Kenny Chua

Reliability of Expt Sources

- **Diff Expt Sources have diff reliabilities**
  - Assign reliability to an interaction based on its expt sources (Nabieva et al, 2004)
- **Reliability betw u and v computed by:**

$$r_{u,v} = 1 - \prod_{i \in E_{u,v}} (1 - r_i)$$

  - **r_i is reliability of expt source i,**
  - **$E_{u,v}$ is the set of expt sources in which interaction betw u and v is observed**

Source	Reliability
Affinity Chromatography	**0.823077**
Affinity Precipitation	**0.455904**
Biochemical Assay	**0.666667**
Dosage Lethality	**0.5**
Purified Complex	**0.891473**
Reconstituted Complex	**0.5**
Synthetic Lethality	**0.37386**
Synthetic Rescue	**1**
Two Hybrid	**0.265407**

Source: Kenny Chua

An "Index" for Function Transfer Based on Reliability of Interactions

- **Take reliability into consideration when computing Equiv Measure:**

$$S'_{R}(u,v) = \frac{2\sum_{w\in(N_u\cap N_v)} r_{u,w}r_{v,w}}{\left(\sum_{w\in N_u} r_{u,w} + \sum_{w\in(N_u\cap N_v)} r_{u,w}(1-r_{v,w})\right) + 2\sum_{w\in(N_u\cap N_v)} r_{u,w}r_{v,w}} \times \frac{2\sum_{w\in(N_u\cap N_v)} r_{u,w}r_{v,w}}{\left(\sum_{w\in N_v} r_{v,w} + \sum_{w\in(N_u\cap N_v)} r_{v,w}(1-r_{u,w})\right) + 2\sum_{w\in(N_u\cap N_v)} r_{u,w}r_{v,w}}$$

- N_k is the set of interacting partners of k
- $r_{u,w}$ is reliability weight of interaction betw u and v

Source: Kenny Chua

Functional Similarity Estimate: Transitive Functional Association

- **If protein u is similar to protein w, and protein w is similar to protein v, proteins u and v may show some degree of similarity**

- **So we estimate functional similarity betw u and v by product of functional similarity betw u and w, and that between w and v:**

$$S_{TR}(u,v) = \max\left(S_R(u,v), \max_{w \in N_u} S_R(u,w) S_R(w,v) \right)$$

Correlation with Functional Similarity

- **Equiv measure shows improved correlation w/ functional similarity when reliability of interactions & transitive association is considered:**

Neighbours	CD-Distance	FS-Weight	FS-Weight R	Transitive FS-Weight R
S_1	0.471810	0.498745	0.532596	**0.532626**
S_2	0.224705	0.298843	0.375317	**0.381966**
$S_1 \cup S_2$	0.224581	0.29629	0.363025	**0.369378**

Source: Kenny Chua

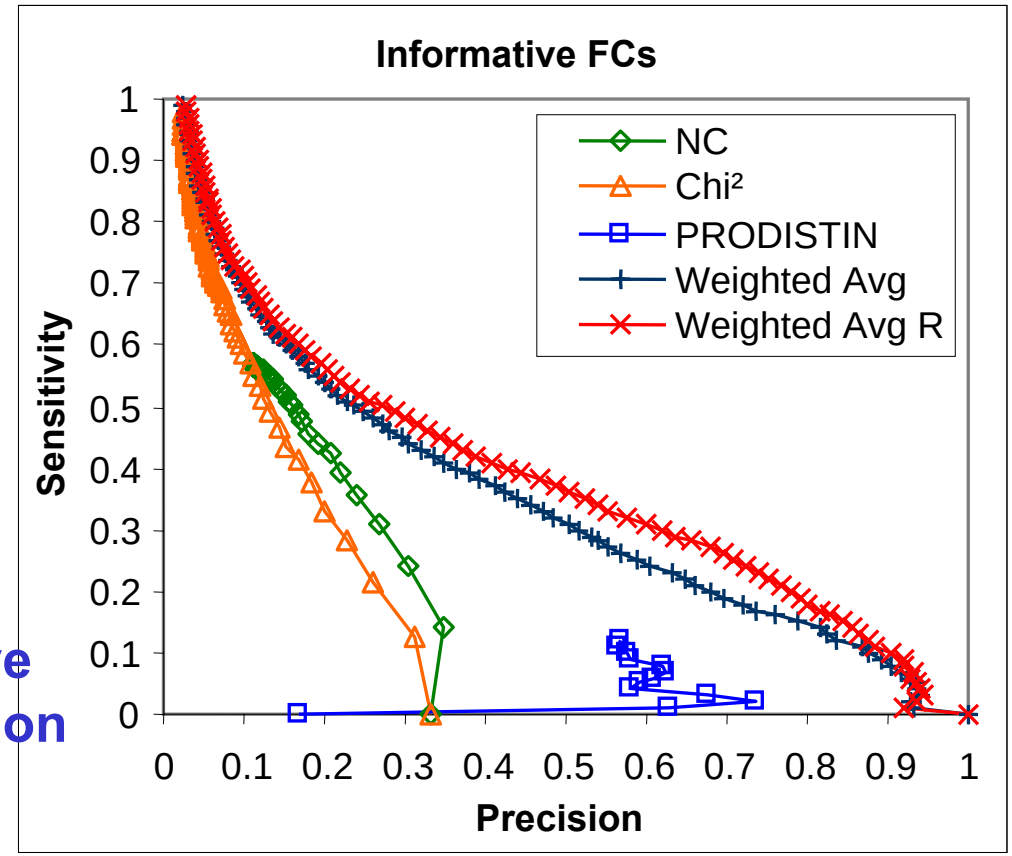
Performance Evaluation

- **Prediction performance improves after incorporation of interaction reliability**

⇒ **Indirect functional association is plausible**

⇒ **It is found often in real interaction data**

⇒ **It can be used to improve protein function prediction from protein interaction data**



Source: Kenny Chua

Application of Sequence Comparison: Key Mutation Site Discovery

Identifying Key Mutation Sites

K.L.Lim et al., *JBC*, 273:28986--28993, 1998

Sequence from a typical PTP domain D2

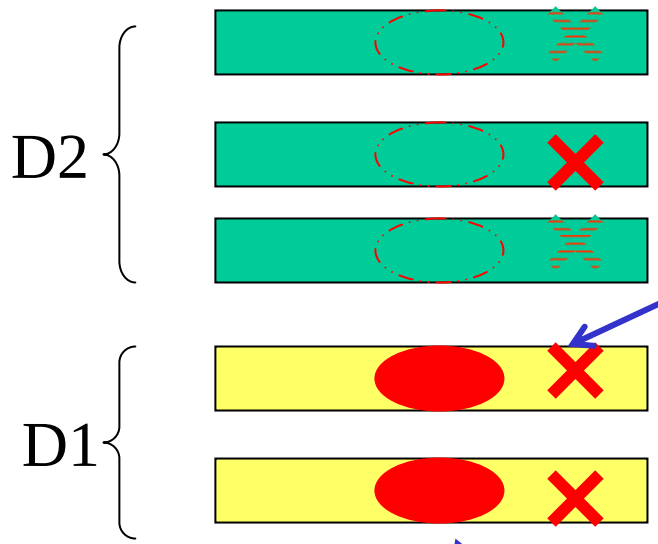
```
>gi|OOOOO|PTPA-D2
EEEFKKLTSIKIQNDKMRTGNLPANMKKNRVLQIIPYEFNRVIIPVKRGEENTDYVNASF
IDGYRQKDSYIASQGPLLHTIEDFWRMIWEWKSCSIVMLTELEERGQEKCAQYWPSDGLV
SYGDITVELKKEEECESYTVRDLLVTNTRENKSRQIRQFHFHGWPEVGIPSDGKGMISII
AAVQKQQQQSGNHPITVHCSAGAGRTGTFCALSTVLERVKAEGILDVFQTVKSLRLQRPH
MVQTLEQYEFCYKVVQEYIDAFSDYANFK
```

- **Some PTPs have 2 PTP domains**
- **PTP domain D1 is has much more activity than PTP domain D2**
- **Why? And how do you figure that out?**

Emerging Patterns of PTP D1 vs D2

- Collect example PTP D1 sequences
- Collect example PTP D2 sequences
- Make multiple alignment A1 of PTP D1
- Make multiple alignment A2 of PTP D2
- Are there positions conserved in A1 that are violated in A2?
- These are candidate mutations that cause PTP activity to weaken
- Confirm by wet experiments

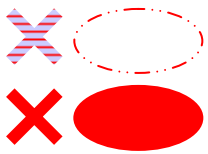
Emerging Patterns of PTP D1 vs D2



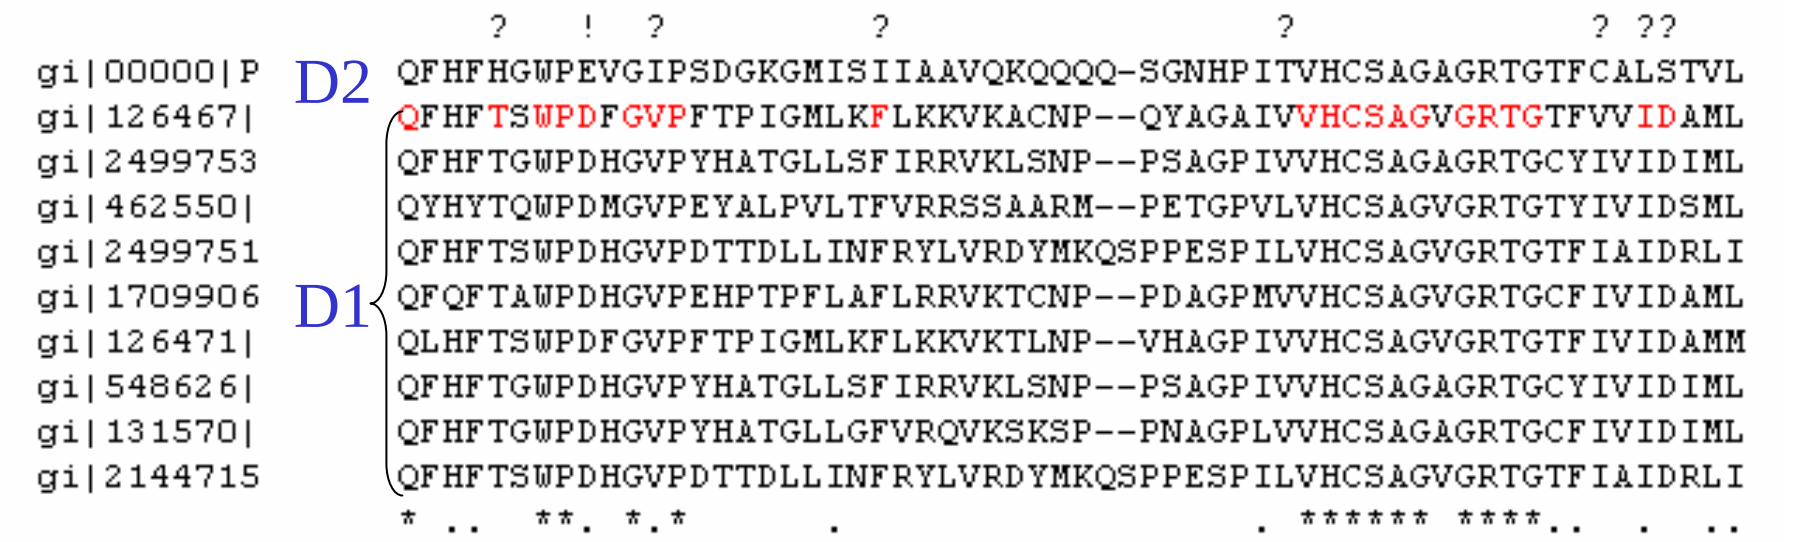
This site is consistently conserved in D1,
but is not consistently missing in D2
⇒ it is not an EP
⇒ not a likely cause of D2's loss of function

Exercise: Why?

This site is consistently conserved in D1,
but is consistently missing in D2
⇒ it is an EP
⇒ possible cause of D2's loss of function



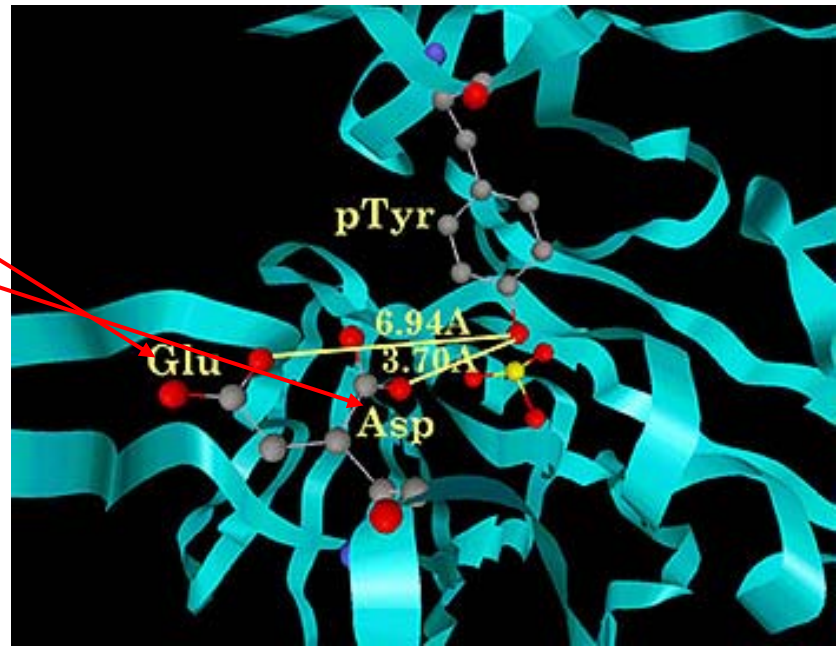
Key Mutation Site: PTP D1 vs D2



- **Positions marked by "!" and "?" are likely places responsible for reduced PTP activity**
  - All PTP D1 agree on them
  - All PTP D2 disagree on them

Key Mutation Site: PTP D1 vs D2

```
                                ?   !   ?
gi|00000|P      D2      QFHFHGWPEVGIPSDGK(
gi|126467|              QFHFTSWPDFGVRFTPI(
gi|2499753              QFHFTGWPDHGVPYHAT(
gi|462550|              QYHYTQWPDMGVPEYAL]
gi|2499751              QFHFTSWPDHGVPDTTD]
gi|1709906      D1      QFQFTAWPDHGVPEHPT]
gi|126471|              QLHFTSWPDFGVPFTPI(
gi|548626|              QFHFTGWPDHGVPYHAT(
gi|131570|              QFHFTGWPDHGVPYHAT(
gi|2144715              QFHFTSWPDHGVPDTTD]
                        * ..  **. *.*
```



- **Positions marked by "!" are even more likely as 3D modeling predicts they induce large distortion to structure**

Confirmation by Mutagenesis Expt

- **What wet experiments are needed to confirm the prediction?**
  - Mutate E $\rightarrow$ D in D2 and see if there is gain in PTP activity
  - Mutate D $\rightarrow$ E in D1 and see if there is loss in PTP activity

Exercise: Why do you need this 2-way expt?

Any Questions?
