CS2220: Introduction to Computational Biology Lecture 7: Sequence Homology Interpretation

Limsoon Wong
28 March 2008

2

Plan

- **Recap of sequence alignment**
- **Guilt by association**
- **Active site/domain discovery**
- **What if no homology of known function is found?**
 - Genome phylogenetic profiling
 - Protfun
 - SVM-Pairwise
 - Protein-protein interactions
- **Key mutation site discovery**

Very Brief Recap of Sequence Comparison/Alignment

4

Motivations for Sequence Comparison

- DNA is blue print for living organisms
 - ⇒ Evolution is related to changes in DNA
 - ⇒ By comparing DNA sequences we can infer evolutionary relationships between the sequences w/o knowledge of the evolutionary events themselves
- Foundation for inferring function, active site, and key mutations

Sequence Alignment

- Key aspect of seq comparison is seq alignment
- A seq alignment maximizes the number of positions that are in agreement in two sequences

Copyright 2008 © Limsoon Wong

Sequence Alignment: Poor Example

- Poor seq alignment shows few matched positions
 ⇒ The two proteins are not likely to be homologous

Alignment by FASTA of the sequences of amicyanin and domain 1 of ascorbate oxidase

	60	70	80	90	100
Amicyanin	MPHNVHFVAGVLGEAALKGPMKKEQAYSLTFFTEAGTYDYHCTPHPPMRGKVVE				
		
Ascorbate Oxidase	ILRGTFWADGTASISQCAINPGETFFYNFTVDNPGTFFYHGLGMQRSAGLYGSLI				
	70	80	90	100	110 120

No obvious match between
Amicyanin and Ascorbate Oxidase

Copyright 2008 © Limsoon Wong

Sequence Alignment: Good Example

- Good alignment usually has clusters of extensive matched positions
- ⇒ The two proteins are likely to be homologous

```

>gi113476732|ref|NP_108301.1| unknown protein [Mesorhizobium loti]
gi114027493|dbj|BAB53762.1| unknown protein [Mesorhizobium loti]
Length = 105

Score = 105 bits (262), Expect = 1e-22
Identities = 61/106 (57%), Positives = 73/106 (68%), Gaps = 1/106 (0%)

```

good match between
Amicyanin and unknown *M. loti* protein

Copyright 2008 © Limsoon Wong

Multiple Alignment: An Example

- Multiple seq alignment maximizes number of positions in agreement across several seqs
- seqs belonging to same “family” usually have more conserved positions in a multiple seq alignment

TFVVIDAMLMMHSEKVDVYGFVSRIRAQRCQMVTDMQYVFIYQALLEHYLYGDTELE
VT

- How do we attempt to assign a function to a new protein sequence?

Copyright 2008 © Limsoon Wong

Guilt-by-Association

- Compare the target sequence T with sequences S_1, \dots, S_n of known function in a database
- Determine which ones amongst S_1, \dots, S_n are the mostly likely homologs of T
- Then assign to T the same function as these homologs
- Finally, confirm with suitable wet experiments

Copyright 2008 © Limsoon Wong

Guilt-by-Association

Compare T with seqs of known function in a db

Poor Sequence Alignment

- Poor seq alignment shows few matched positions
⇒ The two proteins are not likely to be homologous

Alignment by FASTA of the sequences of amicyanin and domain 1 of ascorbate oxidase

```

Amicyanin      60      70      80      90     100
HPRVVFVAGVLGAALGPRKKGQATLSTTAQTDITCTYHFFPRGRVVV
Ascorbate Oxidase  ILQRTFVADGTASISQCAINPGEFFINFTVGRDFFFGKLNQNSAGLVG
                  70      80      90     100
  
```

No obvious match between Amicyanin and Ascorbate Oxidase

Discard this function as a candidate

Good Sequence Alignment

- Good alignment usually has clusters of extensive matched positions
⇒ The two proteins are likely to be homologous

```

>gi11547672|ref|NP_188391.1| unknown protein [Mesochorus loti]

Guilt-by-Association: Caveats

- Ensure that the effect of database size has been accounted for
- Ensure that the function of the homology is not derived via invalid “transitive assignment”
- Ensure that the target sequence has all the key features associated with the function, e.g., active site and/or domain

Law of Large Numbers

- Suppose you are in a room with 365 other people
- Q: What is the prob that a specific person in the room has the same birthday as you?
- A: $1/365 = 0.3\%$
- Q: What is the prob that there is a person in the room having the same birthday as you?
- A: $1 - (364/365)^{365} = 63\%$
- Q: What is the prob that there are two persons in the room having the same birthday?
- A: 100%

Interpretation of P-value

- Seq. comparison progs, e.g. BLAST, often associate a P-value to each hit
 - P-value is interpreted as prob that a random seq has an equally good alignment
 - Suppose the P-value of an alignment is 10^{-6}
 - If database has 10^7 seqs, then you expect $10^7 * 10^{-6} = 10$ seqs in it that give an equally good alignment
- ⇒ Need to correct for database size if your seq comparison prog does not do that!

Exercise: Name a commonly used method for correcting p-value for a situation like this

Copyright 2008 © Limsoon Wong

Lightning Does Strike Twice!

- **Roy Sullivan, a former park ranger from Virginia, was struck by lightning 7 times**
 - 1942 (lost big-toe nail)
 - 1969 (lost eyebrows)
 - 1970 (left shoulder seared)
 - 1972 (hair set on fire)
 - 1973 (hair set on fire & legs seared)
 - 1976 (ankle injured)
 - 1977 (chest & stomach burned)
- **September 1983, he committed suicide**

Cartoon: Ron Hipschman
Data: David Hand

Copyright 2008 © Limsoon Wong

Effect of Seq Compositional Bias

- One fourth of all residues in protein seqs occur in regions with biased amino acid composition
- Alignments of two such regions achieves high score purely due to segment composition

⇒ While it is worth noting that two proteins contain similar low complexity regions, they are best excluded when constructing alignments

- E.g., by default, BLAST employs the SEG algo to filter low complexity regions from proteins before executing a search

Application of Sequence Comparison: Active Site/Domain Discovery

28

Discover Active Site and/or Domain

- **How to discover the active site and/or domain of a function in the first place?**
 - Multiple alignment of homologous seqs
 - Determine conserved positions
 - ⇒ Emerging patterns relative to background
 - ⇒ Candidate active sites and/or domains
- **Easier if sequences of distance homologs are used**

Exercise: Why?

In the course of evolution...

Guilt-by-Association:
What if no homolog of known function is found?

genome phylogenetic profiles
protfun's feature profiles
Similarity of dissimilarities

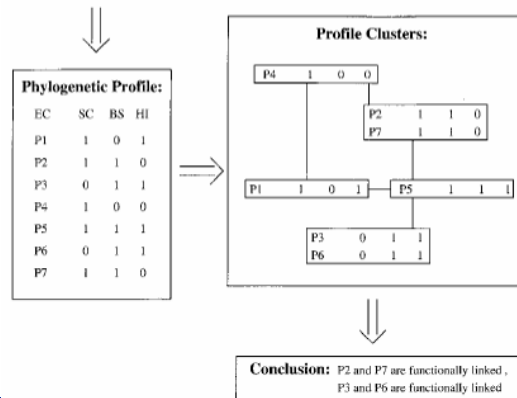

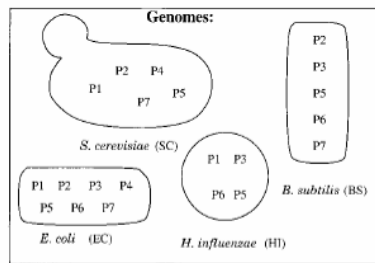

32

Phylogenetic Profiling

Pellegrini et al., *PNAS*, 96:4285--4288, 1999

- Gene (and hence proteins) with identical patterns of occurrence across phyla tend to function together
- ⇒ Even if no homolog with known function is available, it is still possible to infer function of a protein

Phylogenetic Profiling: How it Works

Copyright 2008 © Limsoon Wong

Phylogenetic Profiling: P-value

The probability of observing by chance z occurrences of genes X and Y in a set of N lineages, given that X occurs in x lineages and Y in y lineages is

$$P(z|N, x, y) = \frac{w_z * \bar{w}_z}{W}$$

where

$$\begin{aligned}
 w_z &= \binom{N}{z} \\
 \bar{w}_z &= \binom{N-z}{x-z} * \binom{N-z}{y-z} \\
 W &= \binom{N}{x} * \binom{N}{y}
 \end{aligned}$$

No. of ways to distribute z co-occurrences over N lineage's

No. of ways to distribute the remaining $x-z$ and $y-z$ occurrences over the remaining $N-z$ lineage's

No. of ways of distributing X and Y over N lineage's without restriction

Copyright 2008 © Limsoon Wong

Phylogenetic Profiles: Evidence

Pellegrini et al., *PNAS*, 96:4285--4288, 1999

Keyword	No. of non-homologous proteins in group	No. neighbors in keyword group	No. neighbors in random group
Ribosome	60	197	27
Transcription	36	17	10
tRNA synthase and ligase	26	11	5
Membrane proteins [†]	25	89	5
Flagellar	21	89	3
Iron, ferric, and ferritin	19	31	2
Galactose metabolism	18	31	2
Molybdopterin and Molybdenum, and molybdopterin	12	6	1
Hypothetical [‡]	1,084	108,226	8,440

- *E. coli* proteins grouped based on similar keywords in SWISS-PROT have similar phylogenetic profiles

Copyright 2008 © Limsoon Wong

Phylogenetic Profiling: Evidence

Wu et al., *Bioinformatics*, 19:1524--1530, 2003

- Proteins having low hamming distance (thus highly similar phylogenetic profiles) tend to share common pathways

Exercise: Why do proteins having high hamming distance also have this behaviour?

Copyright 2008 © Limsoon Wong

The ProtFun Approach

Jensen, *JMB*, 319:1257--1265, 2002

- A protein is not alone when performing its biological function
- It operates using the same cellular machinery for modification and sorting as all other proteins do, such as glycosylation, phosphorylation, signal peptide cleavage, ...
- These have associated consensus motifs, patterns, etc.

- Proteins performing similar functions should share some such “features”

⇒ Perhaps we can predict protein function by comparing its “feature” profile with other proteins?

Copyright 2008 © Limsoon Wong

ProtFun: How it Works

Abbreviation	Encoding	Description
ec	single value	Extinction coefficient predicted by ExPASy ProtParam
gravy	single value	Hydrophobicity predicted by ExPASy ProtParam

ProtFun: Evidence

- Combinations of “features” seem to characterize some functional categories

Copyright 2008 © Limsoon Wong

ProtFun: Example Output

	Prion	A4	TTHY
Amino acid biosynthesis	0.011	0.011	0.011
Biosynthesis of cofactors	0.041	0.161	0.034
Cell envelope	0.146	0.804	0.698
Cellular processes	0.027	0.027	0.051
Central intermediary metabolism	0.047	0.139	0.059
Energy metabolism	0.029	0.023	0.046
Fatty acid metabolism	0.017	0.017	0.023
Purines and pyrimidines	0.528	0.417	0.153
Regulatory functions	0.013	0.014	0.014
Replication and transcription	0.020	0.029	0.040
Translation	0.035	0.027	0.032
Transport and binding	0.831	0.827	0.812
Enzyme	0.233	0.367	0.227
Non-enzyme	0.767	0.633	0.773
Oxidoreductase (EC 1.-.-.-)	0.070	0.024	0.055
Transferase (EC 2.-.-.-)	0.031	0.208	0.037
Hydrolase (EC 3.-.-.-)	0.101	0.090	0.208
Isomerase (EC 4.-.-.-)	0.020	0.020	0.020
Ligase (EC 5.-.-.-)	0.010	0.010	0.010
Lyase (EC 6.-.-.-)	0.017	0.078	0.017

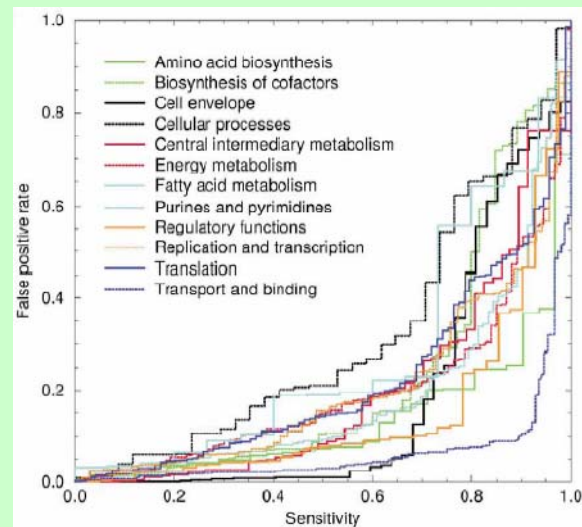

- At the seq level, Prion, A4, & TTHY are dissimilar

- ProtFun predicts them to be cell envelope-related, tranport & binding

- This is in agreement w/ known functionality of these proteins

SVM-Pairwise Framework

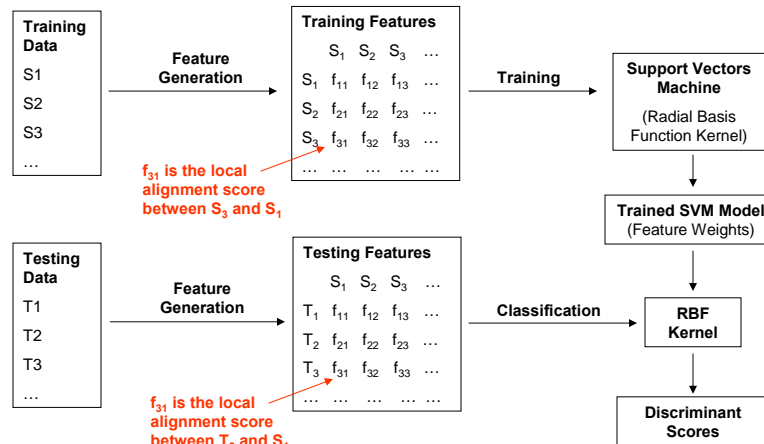

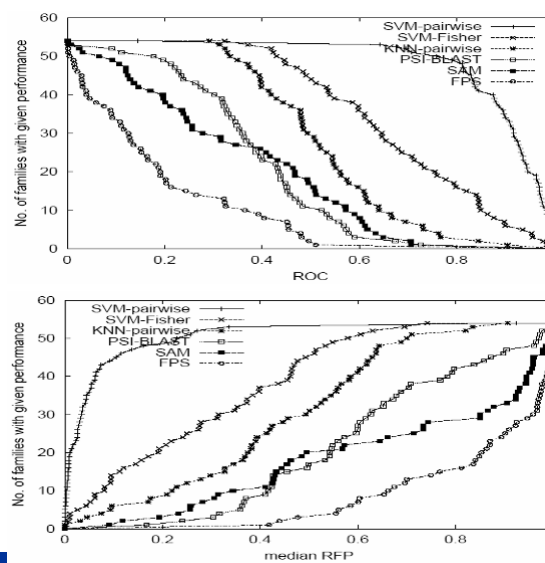

Image credit: Kenny Chua

Copyright 2008 © Limsoon Wong

Performance of SVM-Pairwise

- **Receiver Operating Characteristic (ROC)**
 - The area under the curve derived from plotting true positives as a function of false positives for various thresholds.
- **Rate of median False Positives (RFP)**
 - The fraction of negative test examples with a score better or equals to the median of the scores of positive test examples.

Protein Function Prediction from Protein Interactions

Level-1 neighbour

Level-2 neighbour

46

Functional Association Thru Interactions

- **Direct functional association:**
 - Interaction partners of a protein are likely to share functions w/ it
 - Proteins from the same pathways are likely to interact
- **Indirect functional association**
 - Proteins that share interaction partners with a protein may also likely to share functions w/ it
 - Proteins that have common biochemical, physical properties and/or subcellular localization are likely to bind to the same proteins

Level-1 neighbour

Level-2 neighbour

Copyright 2008 © Limsoon Wong

An illustrative Case of Indirect Functional Association?

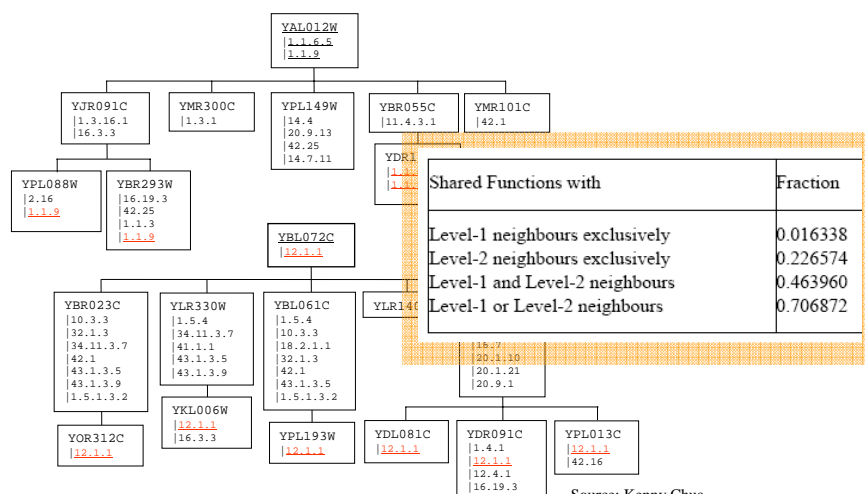

SH3 Proteins SH3-Binding Proteins

- Is *indirect functional association* plausible?
- Is it found often in real interaction data?
- Can it be used to improve protein function prediction from protein interaction data?

Freq of Indirect Functional Association

Copyright 2008 © Limsoon Wong

Prediction Power By Majority Voting

- Remove overlaps in level-1 and level-2 neighbours to study predictive power of “level-1 only” and “level-2 only” neighbours
- Sensitivity vs Precision analysis

$$PR = \frac{\sum_i^K k_i}{\sum_i^K m_i} \quad SN = \frac{\sum_i^K k_i}{\sum_i^K n_i}$$

- n_i is no. of fn of protein i
- m_i is no. of fn predicted for protein i
- k_i is no. of fn predicted correctly for protein i

- ⇒ “level-2 only” neighbours performs better
- ⇒ $L1 \cap L2$ neighbours has greatest prediction power

Copyright 2008 © Limsoon Wong

Functional Similarity Estimate: Czekanowski-Dice Distance

- Functional distance between two proteins (Brun et al, 2003)

$$D(u, v) = \frac{|N_u \Delta N_v|}{|N_u \cup N_v| + |N_u \cap N_v|}$$

- N_k is the set of interacting partners of k
- $X \Delta Y$ is symmetric diff betw two sets X and Y
- Greater weight given to similarity

⇒ Similarity can be defined as

$$S(u, v) = 1 - D(u, v) = \frac{2X}{2X + (Y + Z)}$$

Is this a good measure if u and v have very diff number of neighbours?

Copyright 2008 © Limsoon Wong

Functional Similarity Estimate: FS-Weighted Measure

- FS-weighted measure

$$S(u, v) = \frac{2|N_u \cap N_v|}{|N_u - N_v| + 2|N_u \cap N_v|} \times \frac{2|N_u \cap N_v|}{|N_v - N_u| + 2|N_u \cap N_v|}$$

- N_k is the set of interacting partners of k
- Greater weight given to similarity

⇒ Rewriting this as

$$S(u, v) = \frac{2X}{2X + Y} \times \frac{2X}{2X + Z}$$

Copyright 2008 © Limsoon Wong

Correlation w/ Functional Similarity

- Correlation betw functional similarity & estimates

Neighbours	CD-Distance	FS-Weight
S_1	0.471810	0.498745
S_2	0.224705	0.298843
$S_1 \cup S_2$	0.224581	0.29629

- Equiv measure slightly better in correlation w/ similarity for L1 & L2 neighbours

Copyright 2008 © Limsoon Wong

Reliability of Expt Sources

- Diff Expt Sources have diff reliabilities

- Assign reliability to an interaction based on its expt sources (Nabieva et al, 2004)

- Reliability betw u and v computed by:

$$r_{u,v} = 1 - \prod_{i \in E_{u,v}} (1 - r_i)$$

- r_i is reliability of expt source i ,
- $E_{u,v}$ is the set of expt sources in which interaction betw u and v is observed

Source	Reliability
Affinity Chromatography	0.823077
Affinity Precipitation	0.455904
Biochemical Assay	0.666667
Dosage Lethality	0.5
Purified Complex	0.891473
Reconstituted Complex	0.5
Synthetic Lethality	0.37386
Synthetic Rescue	1
Two Hybrid	0.265407

Copyright 2008 © Limsoon Wong

Functional Similarity Estimate: FS-Weighted Measure with Reliability

- Take reliability into consideration when computing FS-weighted measure:

$$S_R(u, v) = \frac{2 \sum_{w \in (N_u \cap N_v)} r_{u,w} r_{v,w}}{\left(\sum_{w \in N_u - N_v} r_{u,w} + \sum_{w \in (N_u \cap N_v)} r_{u,w} (1 - r_{v,w}) \right) + 2 \sum_{w \in (N_u \cap N_v)} r_{u,w} r_{v,w}} \times \frac{2 \sum_{w \in (N_v \cap N_u)} r_{u,w} r_{v,w}}{\left(\sum_{w \in N_v - N_u} r_{v,w} + \sum_{w \in (N_u \cap N_v)} r_{v,w} (1 - r_{u,w}) \right) + 2 \sum_{w \in (N_u \cap N_v)} r_{u,w} r_{v,w}}$$

- N_k is the set of interacting partners of k
- $r_{u,w}$ is reliability weight of interaction betw u and v

⇒ Rewriting

$$S(u, v) = \frac{2X}{2X + Y} \times \frac{2X}{2X + Z}$$

Copyright 2008 © Limsoon Wong

Integrating Reliability

- Equiv measure shows improved correlation w/ functional similarity when reliability of interactions is considered:

Neighbours	CD-Distance	FS-Weight	FS-Weight R
S_1	0.471810	0.498745	0.532596
S_2	0.224705	0.298843	0.375317
$S_1 \cup S_2$	0.224581	0.29629	0.363025

Improvement to Prediction Power by Majority Voting

Considering only
neighbours w/ FS
weight > 0.2

Improvement to Over-Rep of Functions in Neighbours

Copyright 2008 © Limsoon Wong

Use L1 & L2 Neighbours for Prediction

• FS-weighted Average

$$f_x(u) = \frac{1}{Z} \left[\lambda r_{int} \pi_x + \sum_{v \in N_u} \left(S_{TR}(u, v) \delta(v, x) + \sum_{w \in N_v} S_{TR}(u, w) \delta(w, x) \right) \right]$$

- r_{int} is fraction of all interaction pairs sharing function
- λ is weight of contribution of background freq
- $\delta(k, x) = 1$ if k has function x , 0 otherwise
- N_k is the set of interacting partners of k
- π_x is freq of function x in the dataset
- Z is sum of all weights

$$Z = 1 + \sum_{v \in N_u} \left(S_{TR}(u, v) + \sum_{w \in N_v} S_{TR}(u, w) \right)$$

AAVORQOQOSQWEPITVECSAGAGRTOTTCALSTYLERVKAEGILDVFQTVKSLRLQRPK
EVQTLAQTEFCYKVVQETIDAPSDYAMFK
```

- Some PTPs have 2 PTP domains
- PTP domain D1 is has much more activity than PTP domain D2
- Why? And how do you figure that out?

Copyright 2008 © Limsoon Wong

Emerging Patterns of PTP D1 vs D2

- Collect example PTP D1 sequences
- Collect example PTP D2 sequences
- Make multiple alignment A1 of PTP D1
- Make multiple alignment A2 of PTP D2
- Are there positions conserved in A1 that are violated in A2?
- These are candidate mutations that cause PTP activity to weaken
- Confirm by wet experiments

Copyright 2008 © Limsoon Wong

Emerging Patterns of PTP D1 vs D2

Copyright 2008 © Limsoon Wong

Key Mutation Site: PTP D1 vs D2

```

* .. **.*.* . . . . . ***** .....

```

- Positions marked by “!” and “?” are likely places responsible for reduced PTP activity
 - All PTP D1 agree on them
 - All PTP D2 disagree on them

Copyright 2008 © Limsoon Wong

Key Mutation Site: PTP D1 vs D2

- Positions marked by “!” are even more likely as 3D modeling predicts they induce large distortion to structure

Copyright 2008 © Limsoon Wong

Confirmation by Mutagenesis Expt

- What wet experiments are needed to confirm the prediction?
 - Mutate E → D in D2 and see if there is gain in PTP activity
 - Mutate D → E in D1 and see if there is loss in PTP activity

Exercise: Why do you need this 2-way expt?

Copyright 2008 © Limsoon Wong

Concluding Remarks

68

What have we learned?

- **General methodologies & applications**
 - Guilt by association for protein function inference
 - Invariants for active site discovery
 - Emerging patterns for mutation site discovery
- **Important tactics**
 - Genome phylogenetic profiling
 - Protfun
 - SVM-Pairwise
 - Protein-protein interactions

Any Questions?
