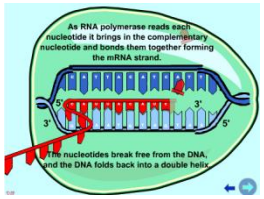
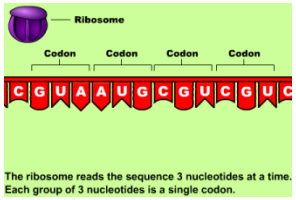
Players in protein synthesis



Transcription

- **Synthesize mRNA from one strand of DNA**
  - An enzyme RNA polymerase temporarily separates double-stranded DNA
  - It begins transcription at transcription start site
  - A → A, C→C, G→G, & T→U
  - Once RNA polymerase reaches transcription stop site, transcription stops
- **Additional "steps" for Eukaryotes**
  - Transcription produces pre-mRNA that contains both introns & exons
  - 5' cap & poly-A tail are added to pre-mRNA
  - RNA splicing removes introns & mRNA is made
  - mRNA are transported out of nucleus



Translation

- Synthesize protein from mRNA
- Each amino acid is encoded by consecutive seq of 3 nucleotides, called a codon
- The decoding table from codon to amino acid is called genetic code

- 4^3=64 diff codons

$\Rightarrow$ Codons are not 1-to-1 corr to 20 amino acids

- All organisms use the same decoding table (except some mitochrondrial genes)
- Amino acids can be classified into 4 groups. A single-base change in a codon is usu insufficient to cause a codon to code for an amino acid in diff group

Genetic code

- **Start codon**
  - ATG (code for M)
- **Stop codon**
  - TAA
  - TAG
  - TGA

First Position	Second Position of Codon: T	Second Position of Codon: C	Second Position of Codon: A	Second Position of Codon: G	Third Position

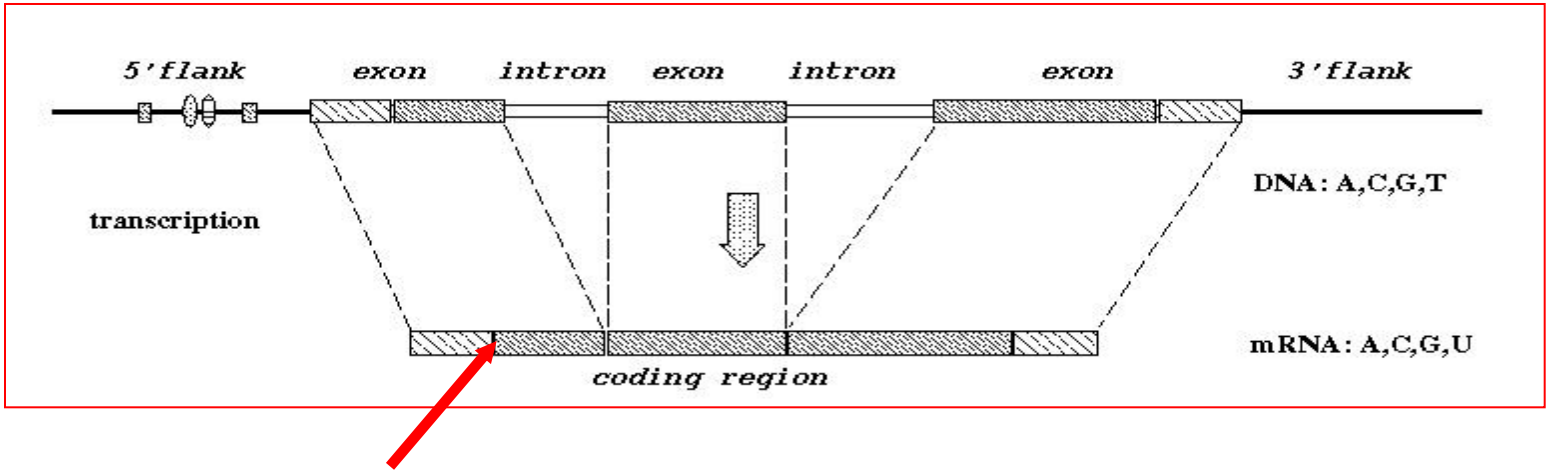
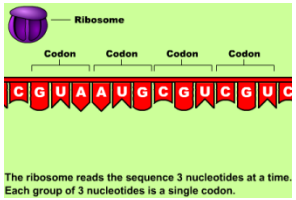
Recognition of Translation Initiation Sites

An introduction to the World's simplest TIS recognition system

Translation initiation site





A sample cDNA

```
 299 HSU27655.1 CAT U27655 Homo sapiens
CGTGTGTGCAGCAGCCTGCAGCTGCCCCAAGCCATGGCTGAACACTGACTCCCAGCTGTG      80
CCCAGGGCTTCAAAGACTTCTCAGCTTCGAGCATGGCTTTTGGCTGTCAGGGCAGCTGTA     160
GGAGGCAGATGAGAAGAGGGAGATGGCCTTGGAGGAAGGGAAGGGGCCTGGTGCCGAGGA     240
CCTCTCCTGGCCAGGAGCTTCCTCCAGGACAAGACCTTCCACCCAACAAGGACTCCCCT
.................................................................  80
.............................iEEEEEEEEEEEEEEEEEEEEEEEEE            160
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE     240
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
```

- **What makes the second ATG the TIS?**

Approach

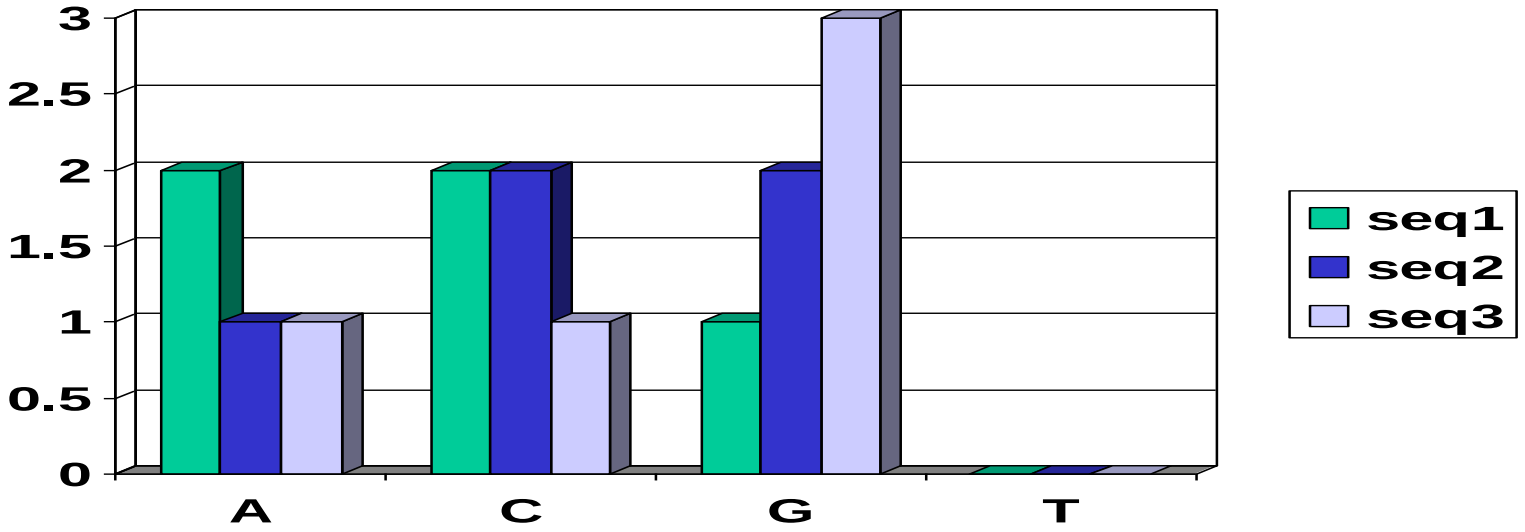
- **Training data gathering**
- **Signal generation**
  - k-grams, distance, domain know-how, ...
- **Signal selection**
  - Entropy, $\chi 2$, CFS, t-test, domain know-how...
- **Signal integration**
  - SVM, ANN, PCL, CART, C4.5, kNN, ...

Training & testing data

- **Vertebrate dataset of Pedersen & Nielsen [ISMB'97]**
- **3312 sequences**
- **13503 ATG sites**
- **3312 (24.5%) are TIS**
- **10191 (75.5%) are non-TIS**
- **Use for 3-fold x-validation expts**

Signal generation

- **K-grams (ie., k consecutive letters)**
  - K = 1, 2, 3, 4, 5, …
  - Window size vs. fixed position
  - Up-stream, downstream vs. any where in window
  - In-frame vs. any frame



Signal generation: Example

```
 299 HSU27655.1 CAT U27655 Homo sapiens
CGTGTGTGCAGCAGCCTGCAGCTGCCCCAAGCCATGGCTGAACACTGACTCCCAGCTGTG      80
CCCAGGGCTTCAAAGACTTCTCAGCTTCGAGCATGGCTTTTGGCTGTCAGGGCAGCTGTA     160
GGAGGCAGATGAGAAGAGGGAGATGGCCTTGGAGGAAGGGAAGGGGCCTGGTGCCGAGGA     240
CCTCTCCTGGCCAGGAGCTTCCTCCAGGACAAGACCTTCCACCCAACAAGGACTCCCCT
```

- **Window = ±100 bases**
- **In-frame, downstream**
  - GCT = 1, TTT = 1, ATG = 1…
- **Any-frame, downstream**
  - GCT = 3, TTT = 2, ATG = 2…
- **In-frame, upstream**
  - GCT = 2, TTT = 0, ATG = 0, ...

Exercise: Find the in-frame downstream ATG

Exercise: What are the possible k-grams (k=3) in this sequence?

Feature generation - Summary

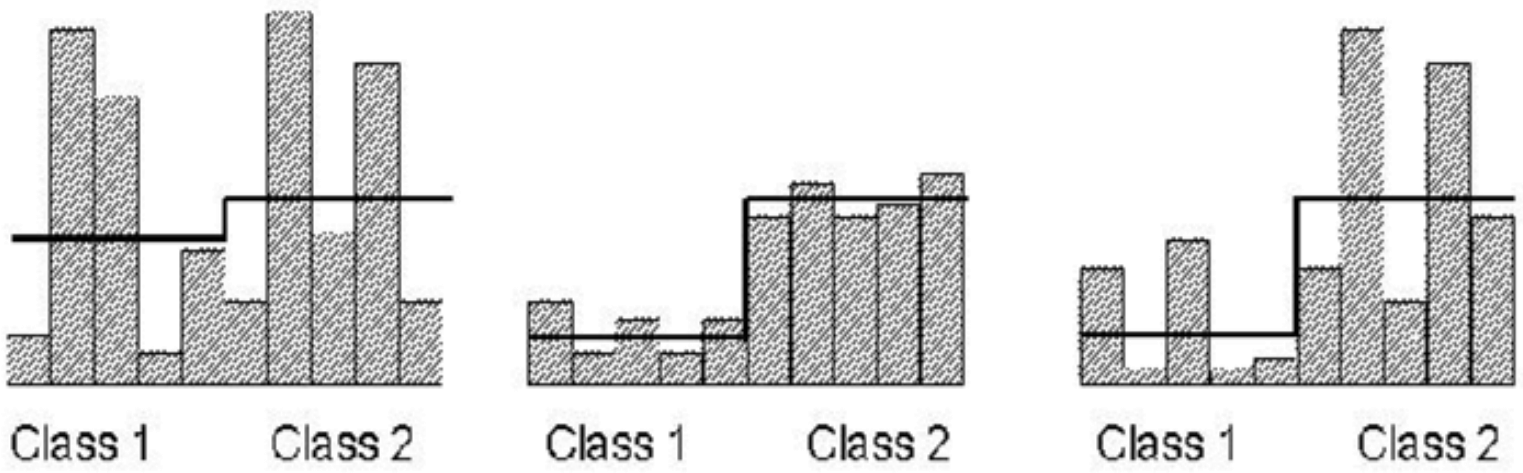
0,1,0,0,0,0,2,2,pos
```

Too many features

- **For each value of k, there are $4^k * 3 * 2$ k-grams**
- **If we use k = 1, 2, 3, 4, 5, we have 24 + 96 + 384 + 1536 + 6144 = 8184 features!**
- **This is too many for most machine learning algorithms**

Signal selection: Basic idea

- **Choose a signal w/ low intra-class distance**
- **Choose a signal w/ high inter-class distance**



Signal selection: E.g., t-statistics

The t-stats of a signal is defined as

$$t = \frac{|\mu_1 - \mu_2|}{\sqrt{(\sigma_1^2/n_1) + (\sigma_2^2/n_2)}}$$

where σ_i^2 is the variance of that signal in class i, μ_i is the mean of that signal in class i, and n_i is the size of class i.

Signal selection: E.g., MIT-correlation

The MIT-correlation value of a signal is defined as

$$MIT = \frac{|\mu_1 - \mu_2|}{\sigma_1 + \sigma_2}$$

where σ_i is the standard deviation of that signal in class i and μ_i is the mean of that signal in class i.

NUS National University of Singapore

Signal selection: E.g., $\chi 2$

The $\mathcal{X}^2$ value of a signal is defined as:

$$\mathcal{X}^2 = \sum_{i=1}^{m} \sum_{j=1}^{k} \frac{(A_{ij} - E_{ij})^2}{E_{ij}},$$

where m is the number of intervals, k the number of classes, A_{ij} the number of samples in the ith interval, jth class, R_i the number of samples in the ith interval, C_j the number of samples in the jth class, N the total number of samples, and E_{ij} the expected frequency of A_{ij} ($E_{ij} = R_i * C_j / N$).

Example

- **Suppose you have a sample of 50 men and 50 women and the following weight distribution is observed:**

	obs	exp	$(obs - exp)^2/exp$
HM	40	60*50/100=30	3.3
HW	20	60*50/100=30	3.3
LM	10	40*50/100=20	5.0
LW	30	40*50/100=20	5.0

$\chi 2=16.6$
P = 0.00004,
df = 1
So weight and sex are not indep

- **Is weight a good attribute for distinguishing men from women?**

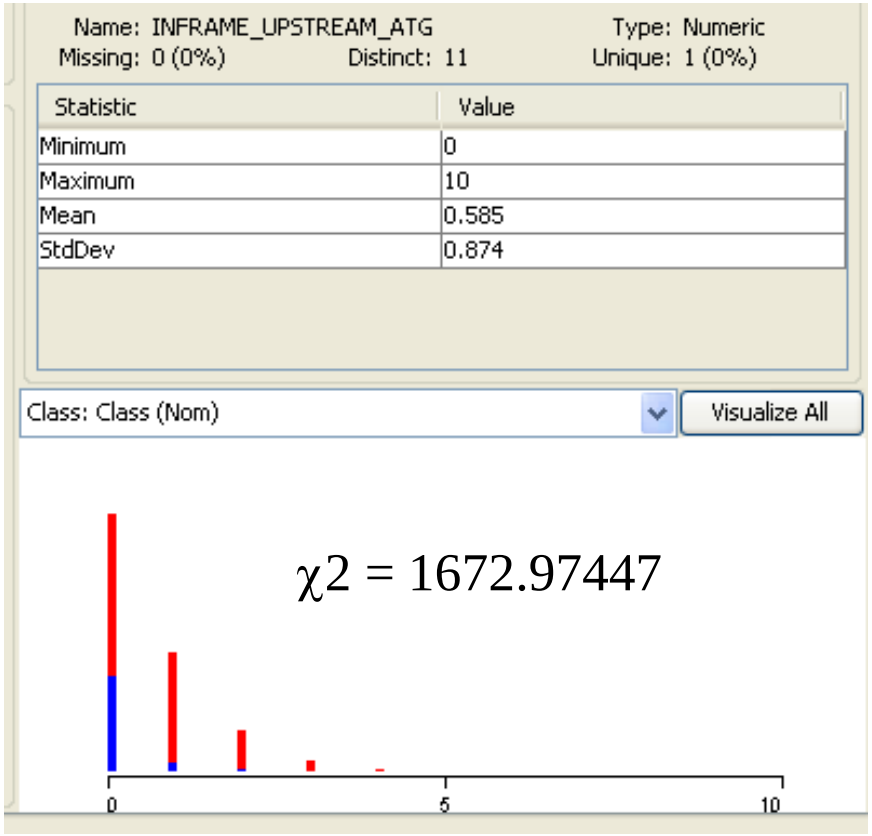
Signal selection: E.g., CFS

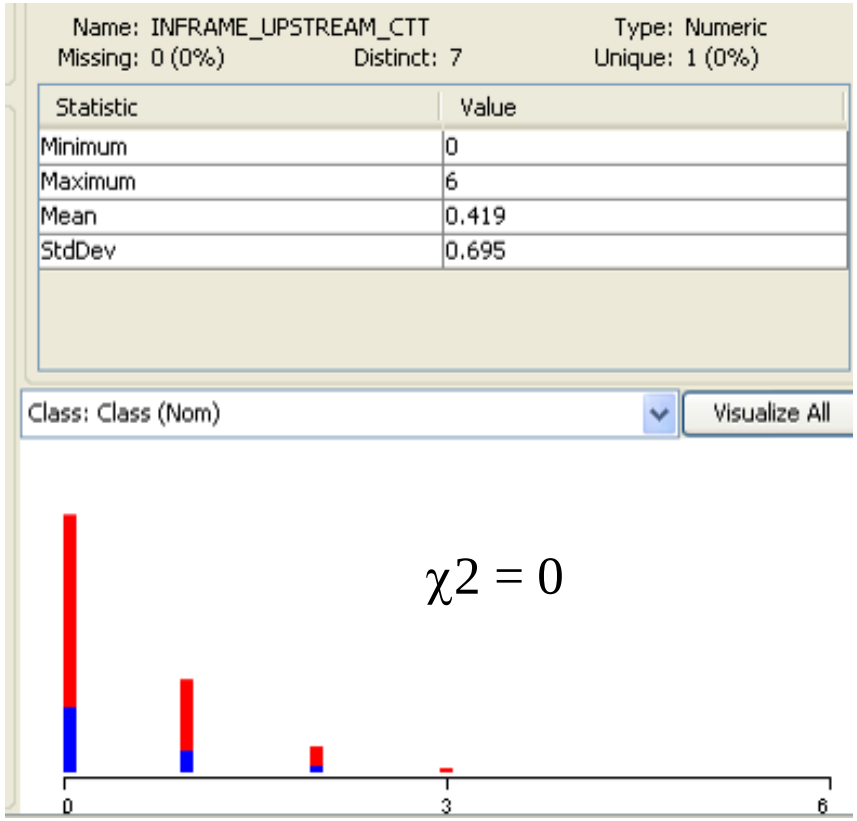
- **Instead of scoring individual signals, how about scoring a group of signals as a whole?**

- **CFS**
  - Correlation-based Feature Selection
  - A good group contains signals that are highly correlated with the class, and yet uncorrelated with each other

Exercise: What is the main challenge in implementing CFS?

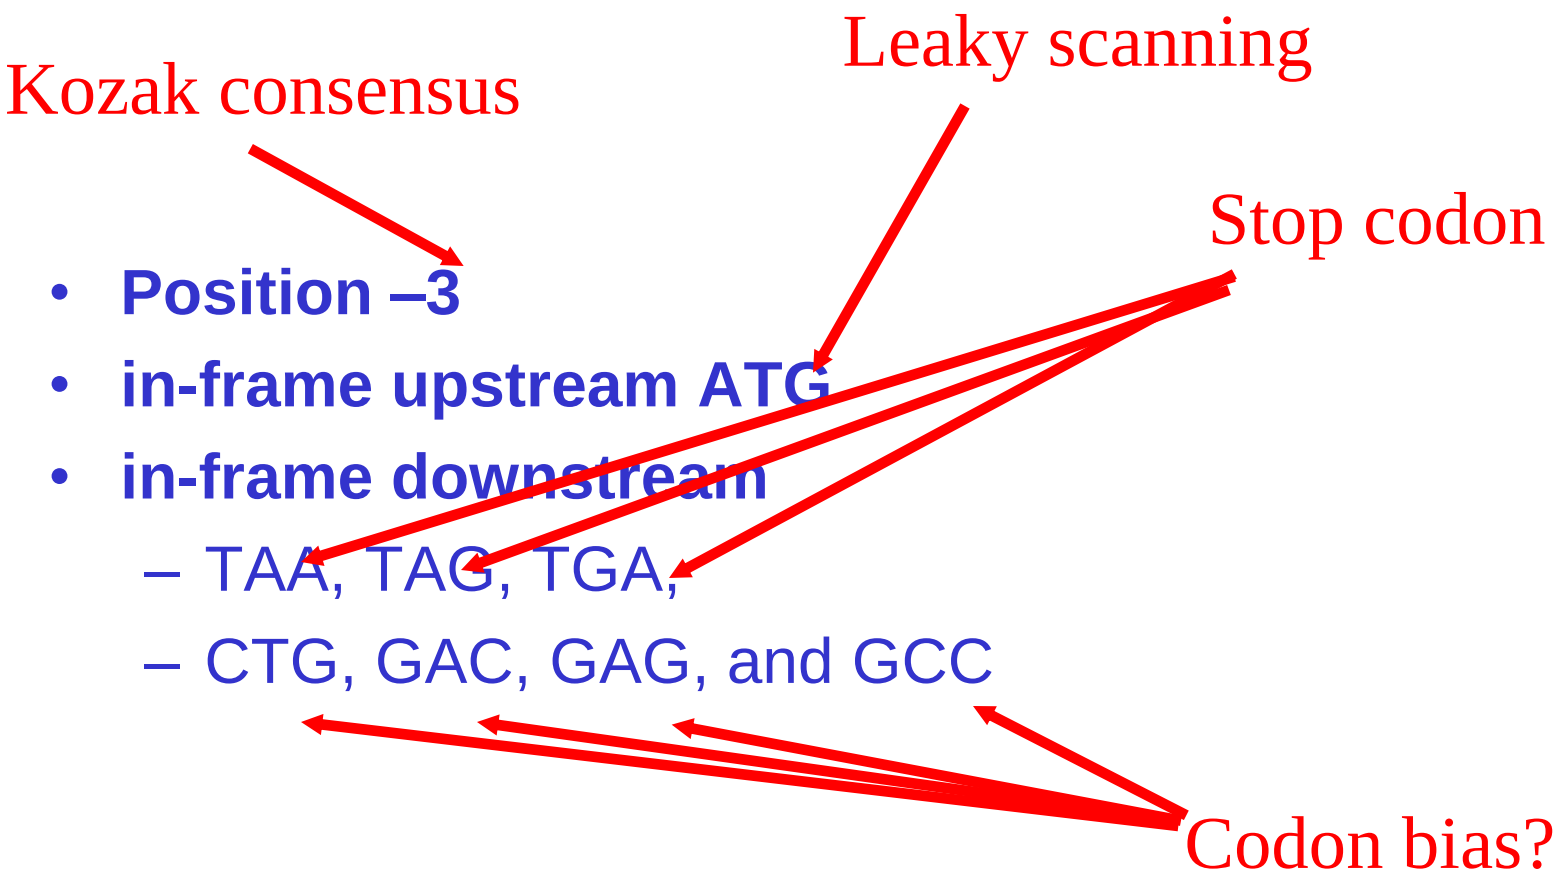
Distributions of two 3-grams





- **Which is the better one?**

Sample k-grams selected by CFS for recognizing TIS



- **Position –3**
- **in-frame upstream ATG**
- **in-frame downstream**
  - TAA, TAG, TGA,
  - CTG, GAC, GAG, and GCC

NUS National University of Singapore

Signal integration

- **kNN**
  - Given a test sample, find the k training samples that are most similar to it. Let the majority class win
- **SVM**
  - Given a group of training samples from two classes, determine a separating plane that maximises the margin of error
- **Naïve Bayes, ANN, C4.5, ...**

Results: 3-fold x-validation

	predicted as positive	predicted as negative
positive	TP	FN
negative	FP	TN

Exercise:
What is TP/(TP+FP)?

	TP/(TP + FN)	TN/(TN + FP)	TP/(TP + FP)	Accuracy
Naïve Bayes	84.3%	86.1%	66.3%	85.7%
SVM	73.9%	93.2%	77.9%	88.5%
Neural Network	77.6%	93.2%	78.8%	89.4%
Decision Tree	74.0%	94.4%	81.1%	89.4%

NUS National University of Singapore

Improvement by voting

- **Apply any 3 of Naïve Bayes, SVM, Neural Network, & Decision Tree. Decide by majority**

	TP/(TP + FN)	TN/(TN + FP)	TP/(TP + FP)	Accuracy
NB+SVM+NN	79.2%	92.1%	76.5%	88.9%
NB+SVM+Tree	78.8%	92.0%	76.2%	88.8%
NB+NN+Tree	77.6%	94.5%	82.1%	90.4%
SVM+NN+Tree	75.9%	94.3%	81.2%	89.8%
Best of 4	84.3%	94.4%	81.1%	89.4%
Worst of 4	73.9%	86.1%	66.3%	85.7%

NUS National University of Singapore

Improvement by scanning

- **Apply Naïve Bayes or SVM left-to-right until first ATG predicted as positive. That's the TIS**
- **Naïve Bayes & SVM models were trained using TIS vs. Up-stream ATG**

	TP/(TP + FN)	TN/(TN + FP)	TP/(TP + FP)	Accuracy
NB	84.3%	86.1%	66.3%	85.7%
SVM	73.9%	93.2%	77.9%	88.5%
NB+Scanning	87.3%	96.1%	87.9%	93.9%
SVM+Scanning	88.5%	96.3%	88.6%	94.4%

Performance comparison

	TP/(TP + FN)	TN/(TN + FP)	TP/(TP + FP)	Accuracy
NB	84.3%	86.1%	66.3%	85.7%
Decision Tree	74.0%	94.4%	81.1%	89.4%
NB+NN+Tree	77.6%	94.5%	82.1%	90.4%
SVM+Scanning	88.5%	96.3%	88.6%	94.4%*
Pedersen&Nielsen	78%	87%	-	85%
Zien	69.9%	94.1%	-	88.1%
Hatzigeorgiou	-	-	-	94%*

* result not directly comparable

Technique comparison

- **Pedersen&Nielsen [ISMB'97]**
  - Neural network
  - No explicit features
- **Zien [Bioinformatics'00]**
  - SVM+kernel engineering
  - No explicit features
- **Hatzigeorgiou [Bioinformatics'02]**
  - Multiple neural networks

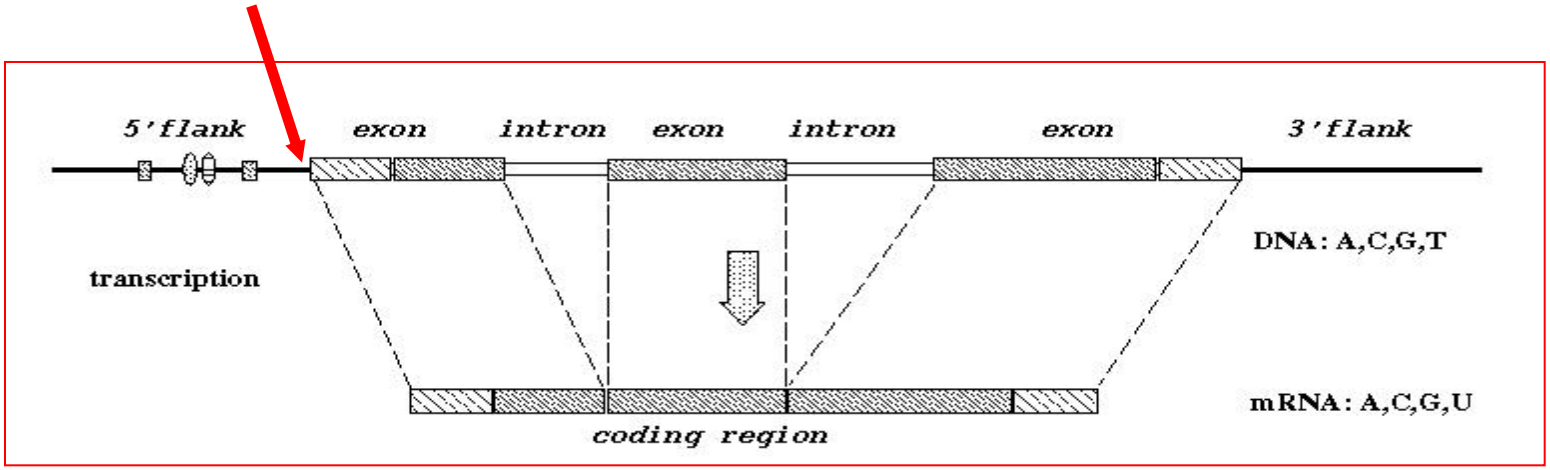
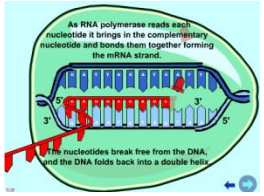
Recognition of Transcription Start Sites

An introduction to the World's best TSS recognition system:

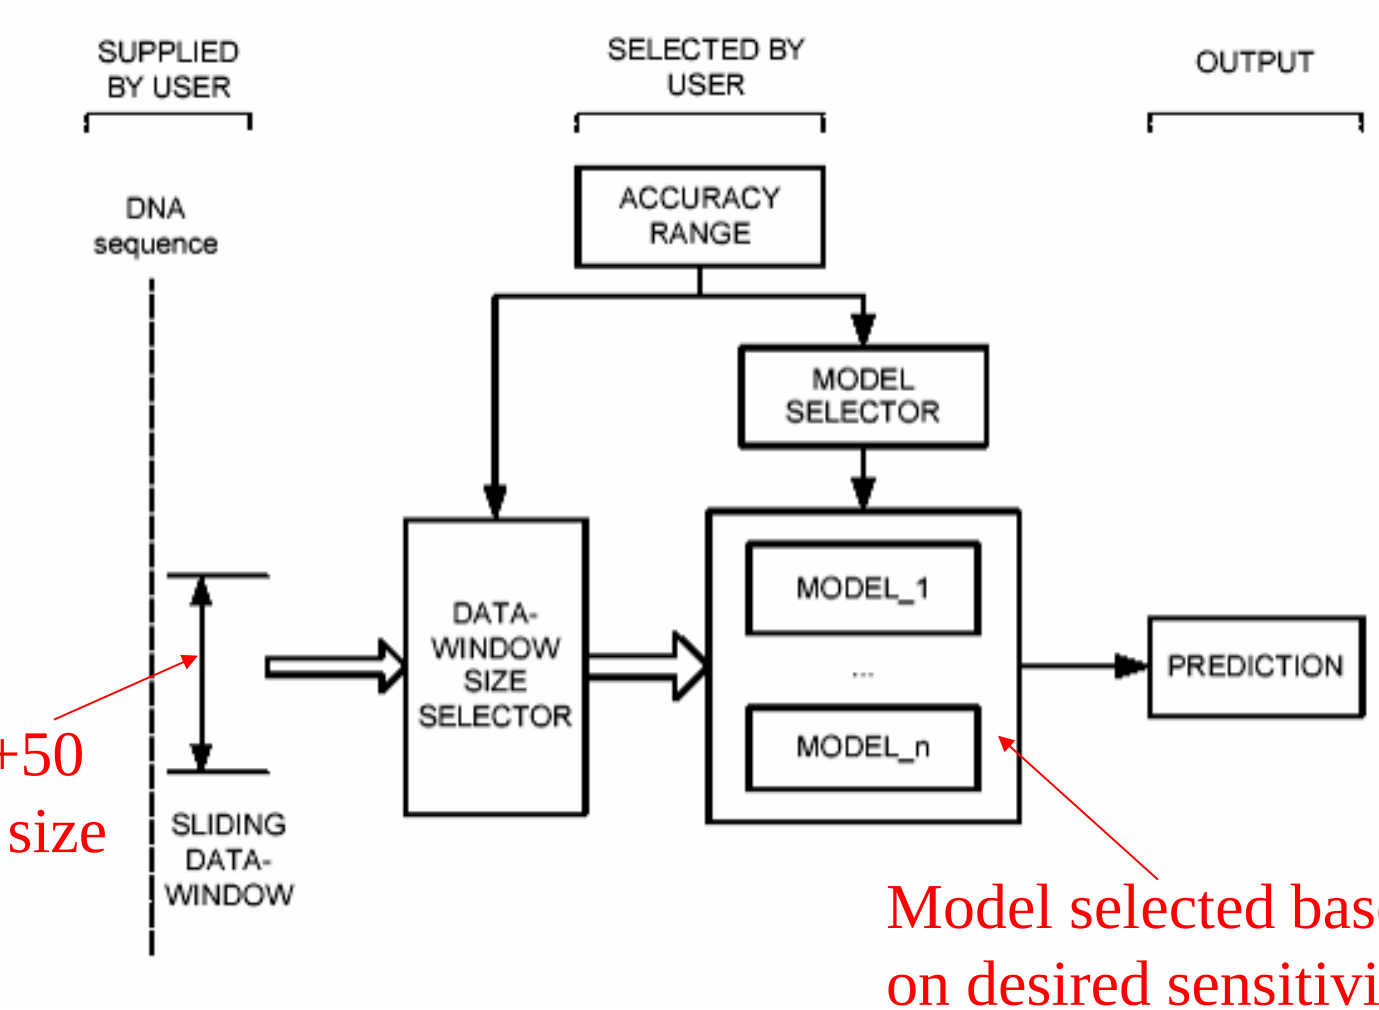
A heavy tuning approach

Transcription start site

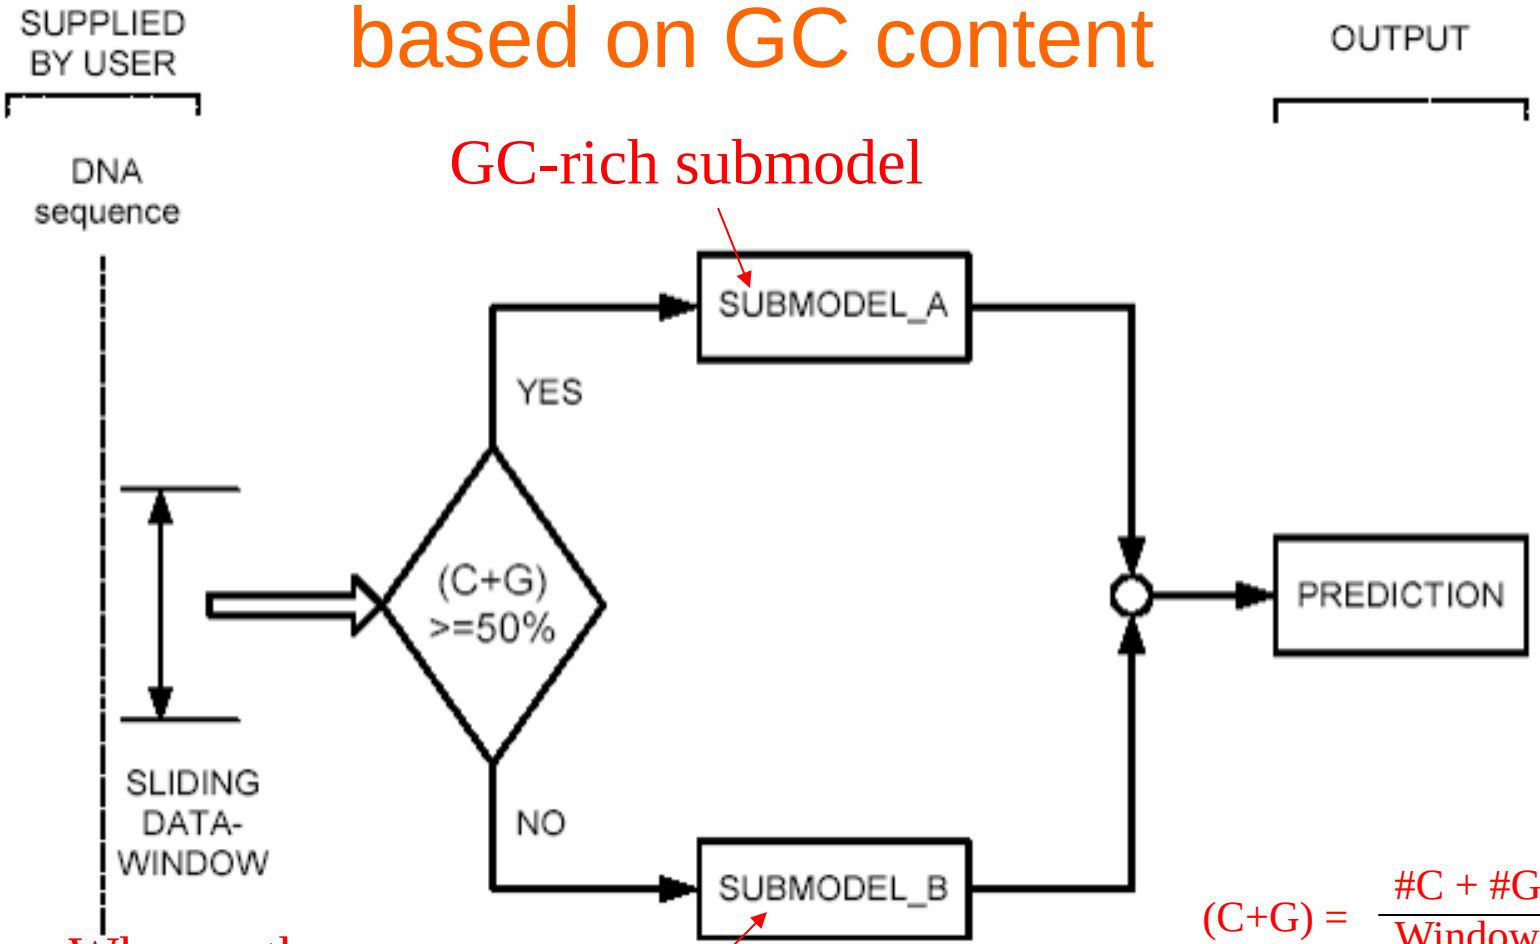




Structure of Dragon Promoter Finder



Each model has two submodels based on GC content



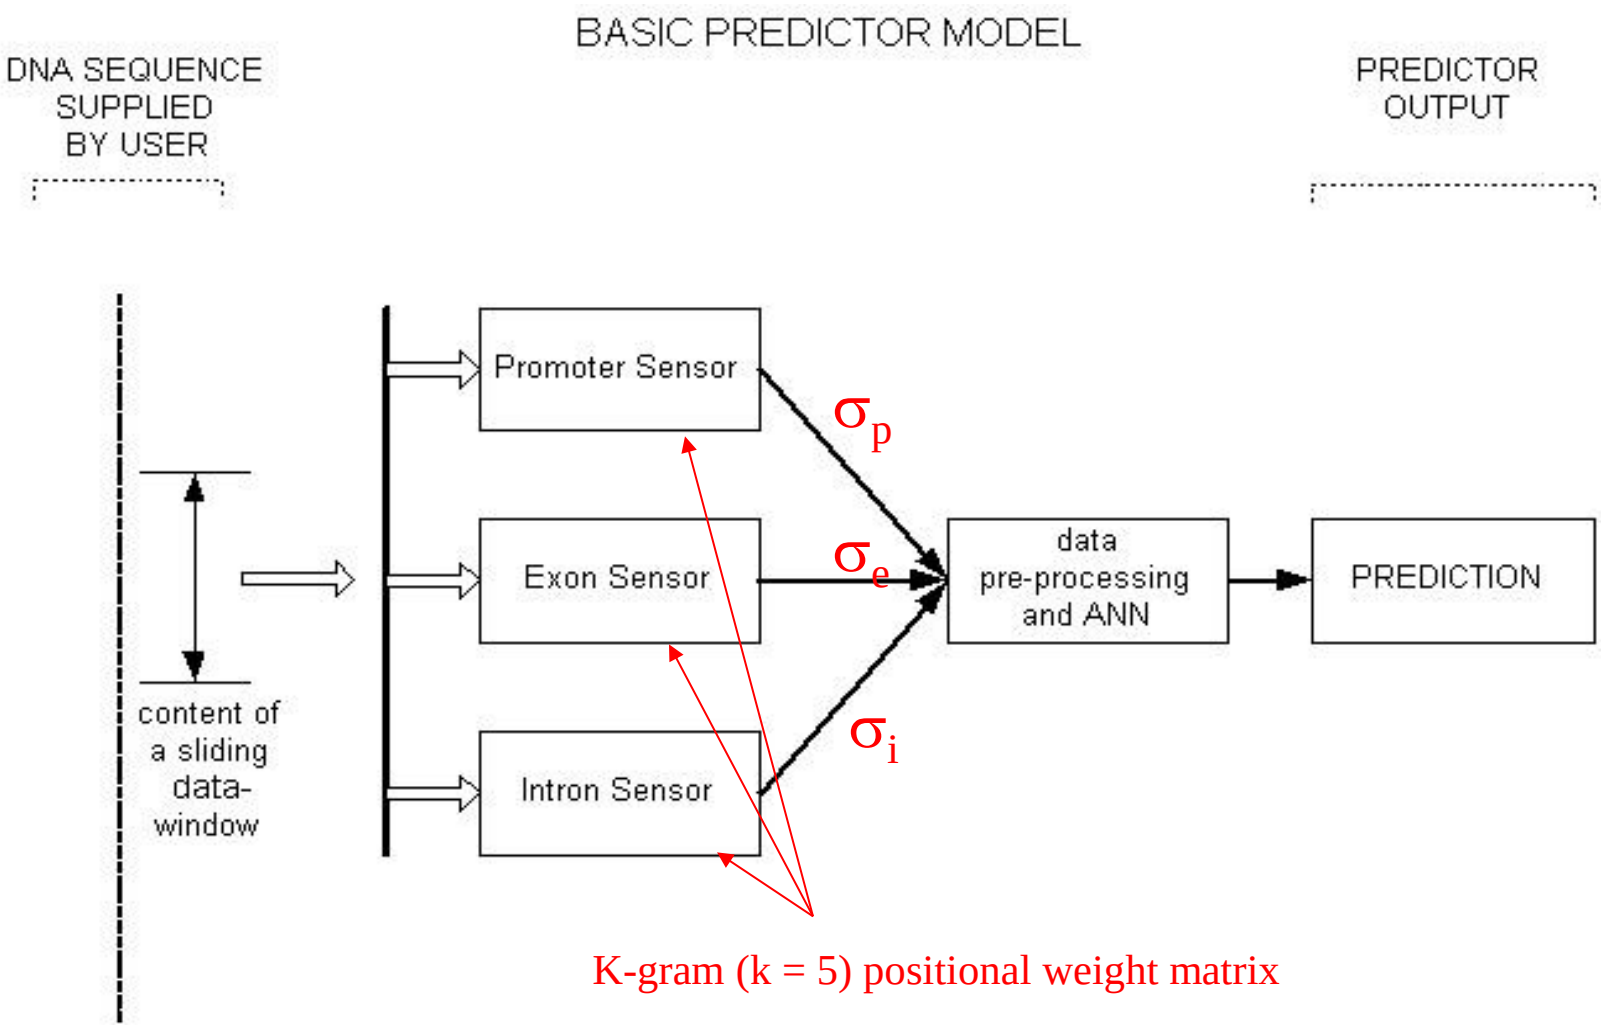
GC-rich submodel

GC-poor submodel

$$(C+G) = \frac{\#C + \#G}{\text{Window Size}}$$

Exercise: Why are the submodels based on GC content?

Data analysis within submodel



Promoter, exon, intron sensors

- **These sensors are positional weight matrices of k-grams, k = 5 (aka pentamers)**
- **They are calculated as below using promoter, exon, intron data respectively**

Window size

$$\sigma = \frac{\left(\sum_{i=1}^{L-4} p_j^i \otimes f_{j,i} \right)}{\left(\sum_{i=1}^{L-4} \max_j f_{j,i} \right)},$$

Frequency of jth pentamer at ith position in training window

Pentamer at i^{th} position in input

$$p_j^i \otimes f_{j,i} = \begin{cases} f_{j,i}, \text{ if } p_i = p_j^i \\ 0, \text{ if } p_i \neq p_j^i \end{cases},$$

j^{th} pentamer at i^{th} position in training window

Just to make sure you know what I mean …

- **Give me 3 DNA seq of length 10:**
  - Seq_1 = ACCGAGTTCT
  - Seq_2 = AGTGTACCTG
  - Seq_3 = AGTTCGTATG
- **Then**

1-mer	pos1	pos2	pos3	pos4	pos5	pos6	pos7	pos8	pos9	pos10
A	3/3	0/3	0/3							
C	0/3	1/3	1/3		Exercise: Fill in the rest of the table					
G	0/3	2/3	0/3							
T	0/3	0/3	2/3							

Just to make sure you know what I mean …

- **Give me 3 DNA seq of length 10:**
  - Seq_1 = ACCGAGTTCT
  - Seq_2 = AGTGTACCTG
  - Seq_3 = AGTTCGTATG
- **Then**

Exercise: How many rows should this 2-mer table have? How many rows should the pentamer table have?

2-mer	pos1	pos2	pos3	pos4	pos5	pos6	pos7	pos8	pos9
AA	0/3	0/3	0/3						
AC	1/3	0/3	0/3		Exercise: Fill in the rest of the table				
…	…	…	…						
TT	0/3	0/3	1/3				1/3		

Data preprocessing & ANN

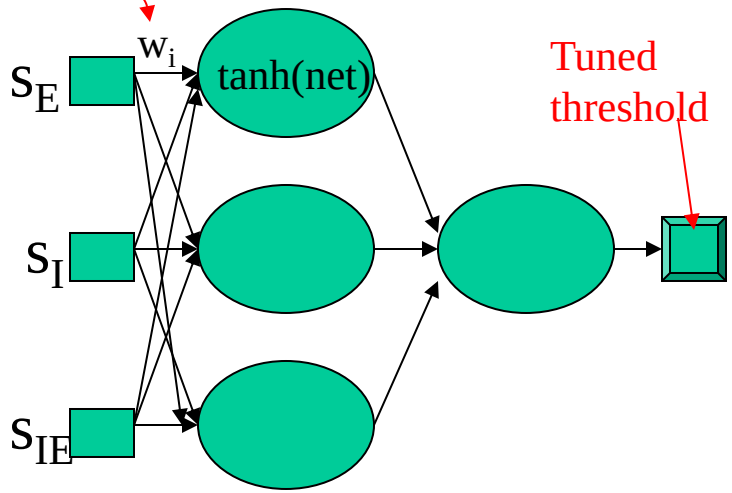
Tuning parameters

$$s_E = sat(\sigma_p - \sigma_e, a_e, b_e),$$
$$s_I = sat(\sigma_p - \sigma_i, a_i, b_i),$$
$$s_{EI} = sat(\sigma_e - \sigma_i, a_{ei}, b_{ei}),$$

where the function sat is defined by

$$sat(x,a,b) = \begin{cases} a, \ if & x > a \\ x, \ if & b \le x \le a. \\ b, \ if & b > x \end{cases}$$

Simple feedforward ANN trained by the Bayesian regularisation method

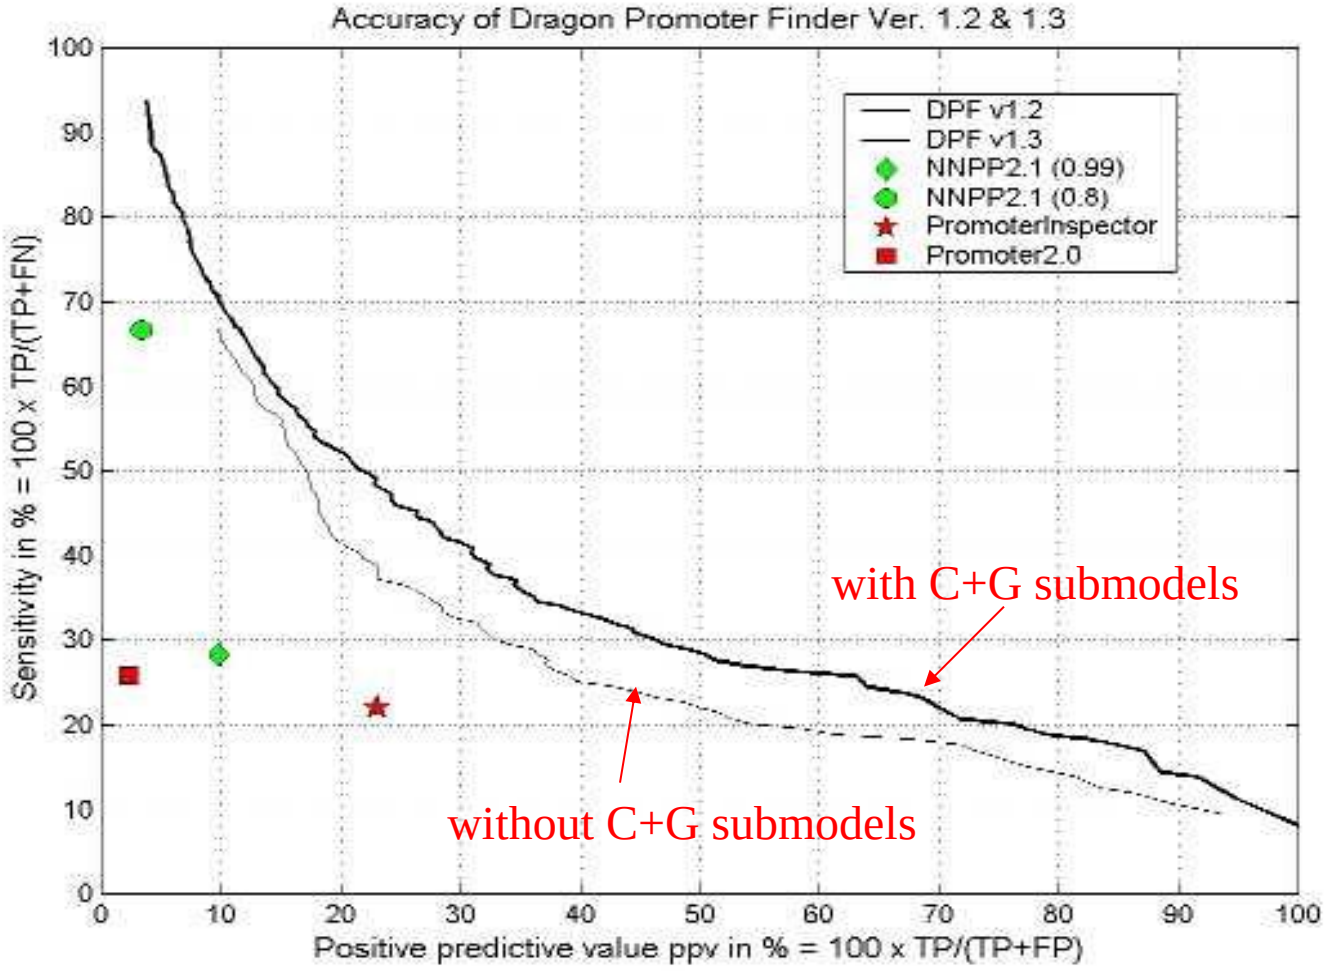


$$\tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

$$net = \Sigma\, s_i * w_i$$

NUS National University of Singapore

Accuracy comparison



Training data criteria & preparation

- **Contain both positive and negative sequences**
- **Sufficient diversity, resembling different transcription start mechanisms**
- **Sufficient diversity, resembling different non-promoters**
- **Sanitized as much as possible**

- **TSS taken from**
  - 793 vertebrate promoters from EPD
  - -200 to +50 bp of TSS
- **non-TSS taken from**
  - GenBank,
  - 800 exons
  - 4000 introns,
  - 250 bp,
  - non-overlapping,
  - <50% identities

Tuning data preparation

- **To tune adjustable system parameters in Dragon, we need a separate tuning data set**

- **TSS taken from**
  - 20 full-length gene seqs with known TSS
  - -200 to +50 bp of TSS
  - no overlap with EPD

- **Non-TSS taken from**
  - 1600 human 3'UTR seqs
  - 500 human exons
  - 500 human introns
  - 250 bp
  - no overlap

Testing data criteria & preparation

- **Seqs should be from the training or evaluation of other systems (no bias!)**
- **Seqs should be disjoint from training and tuning data sets**
- **Seqs should have TSS**
- **Seqs should be cleaned to remove redundancy, <50% identities**
- **159 TSS from 147 human and human virus seqs**
- **cummulative length of more than 1.15Mbp**
- **Taken from GENESCAN, GeneId, Genie, etc.**

Recognition of Poly-A Signal Sites

A twist to the "feature generation, feature selection, feature integration" approach

Eukaryotic pre-mRNA processing

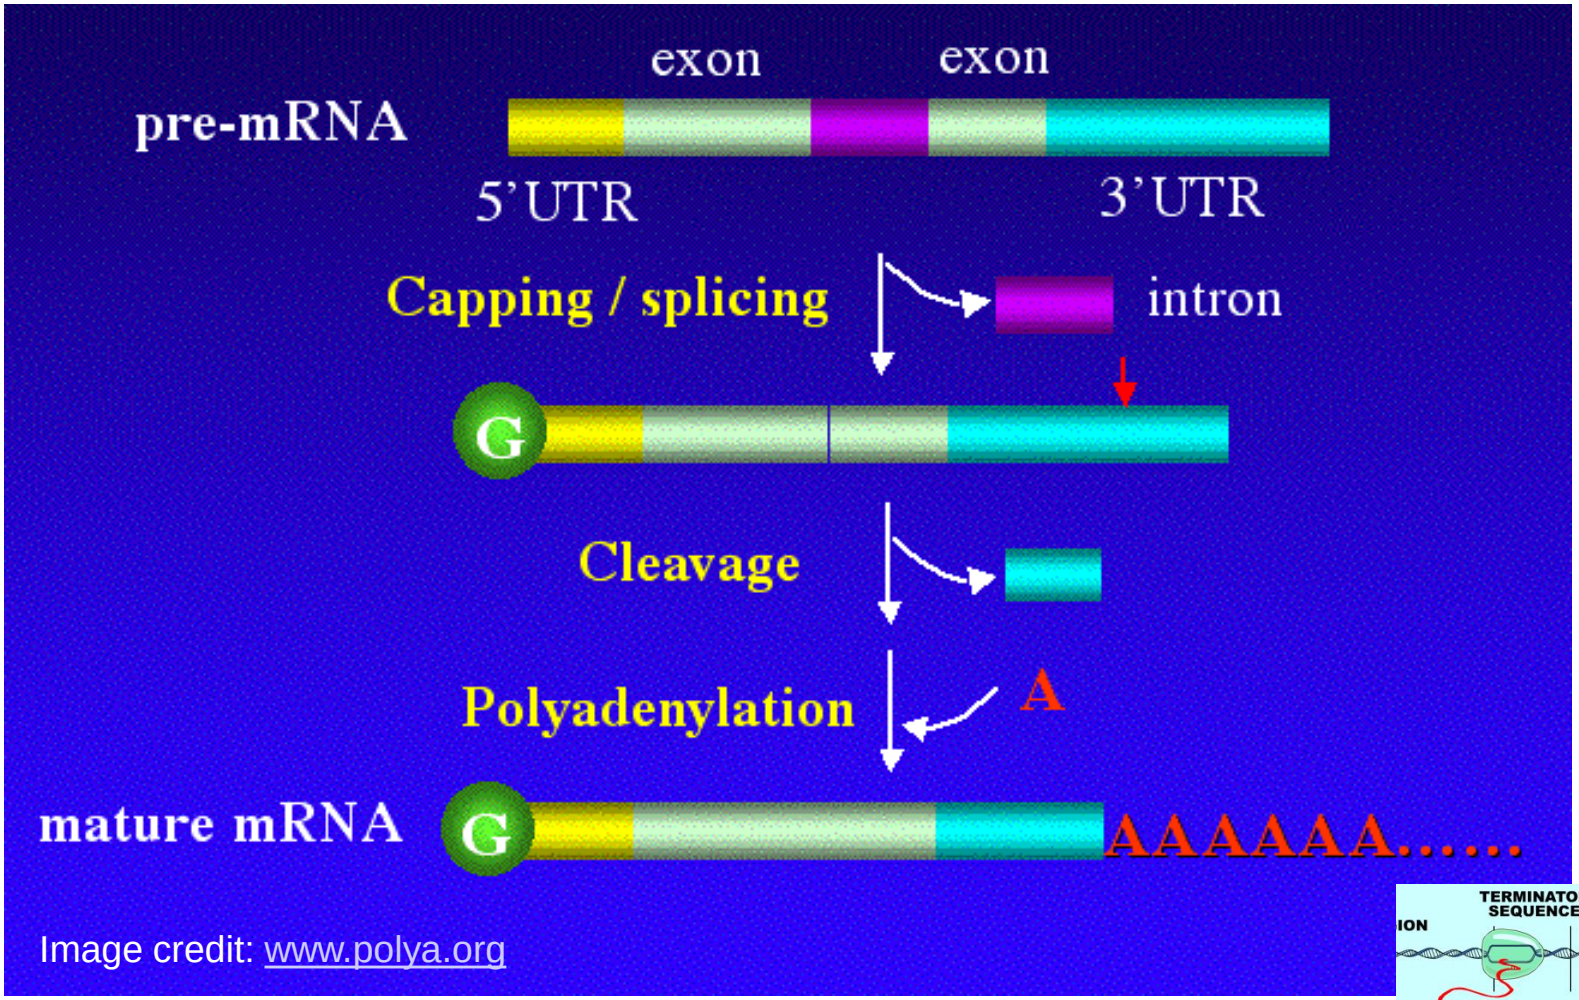

Image credit: www.polya.org

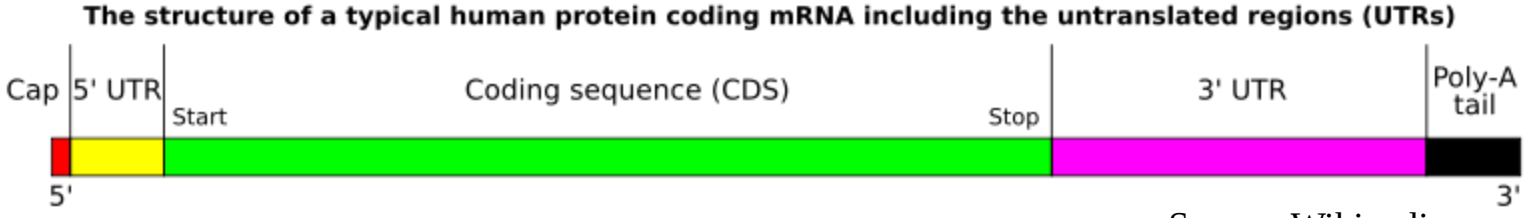
Polyadenylation in eukaryotes

- **Addition of poly(A) tail to RNA**
  - Begins as transcription finishes
  - 3'-most segment of newly-made RNA is cleaved off
  - Poly(A) tail is then synthesized at 3' end
- **Poly(A) tail is impt for nuclear export, translation & stability of mRNA**
- **Tail is shortened over time. When short enough, the mRNA is degraded**



Source: Wikipedia

Poly-A signals in human (Gautheret et al., 200

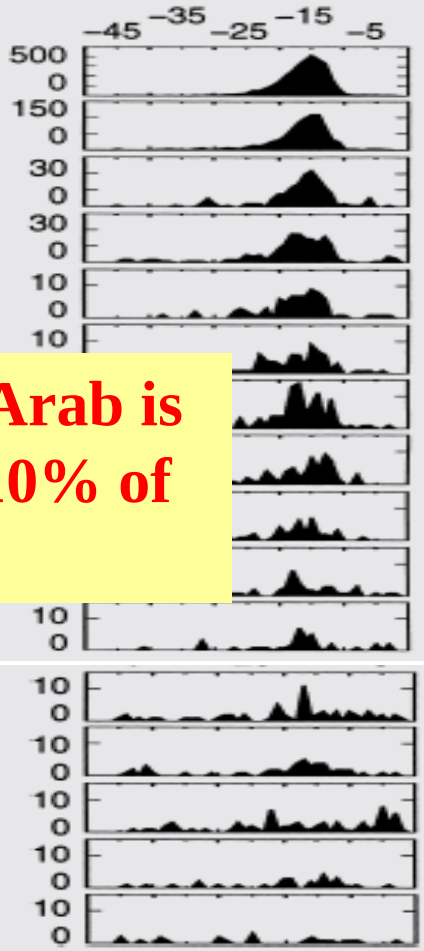
Poly-A signals in Arabidopsis

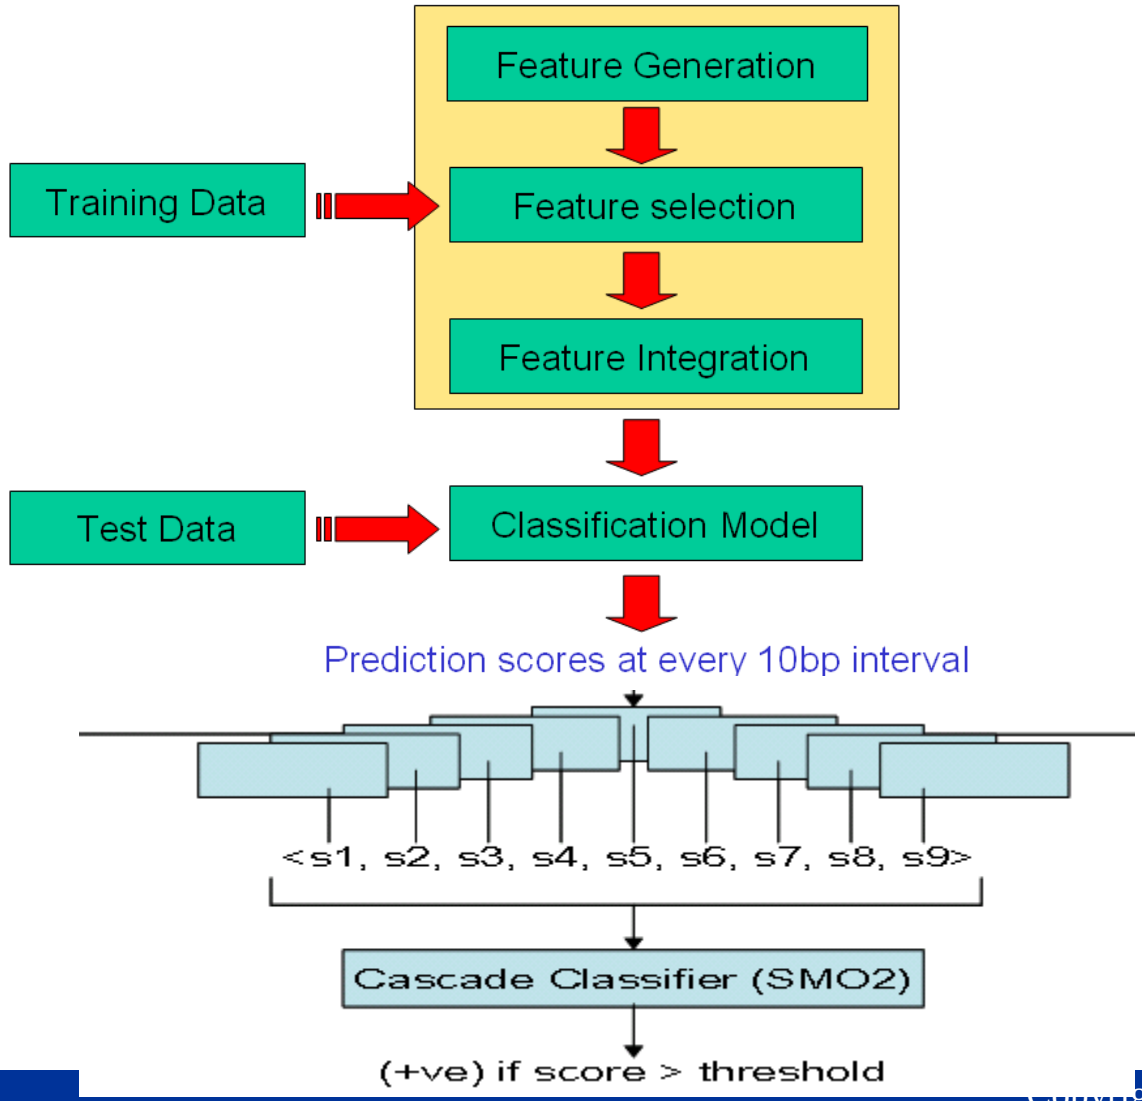
Table 2. Most Significant Hexamers in 3′ Fragments: Clustered Hexamers

Hexamer	Observed (expected)[a]	% sites	*p*[b]	Position average ± SD	Location[c]
AAUAAA	3286 (317)	58.2	0	−16 ± 4.7	
AUUAAA	843 (112)	14.9	0	−17 ± 5.3	
AGUAAA	156 (32)	2.7	6×10^{-57}	−16 ± 5.9	
UAUAAA	180 (53)	3.2	4×10^{-45}	−18 ± 7.8	
CAUAAA	76 (23)	1.3	1×10^{-16}	−17 ± 5.9	
GAUAAA	72				
AAUAUA	96				
AAUACA	70				
AAUAGA	43				
AAAAAG	49				
ACUAAA	36 (11)	0.6	1×10^{-06}	−17 ± 8.1	
AAGAAA	62 (10)	1.1	9×10^{-26}	−19 ± 11	
AAUGAA	49 (10)	0.8	4×10^{-16}	−20 ± 10	
UUUAAA	69 (20)	1.2	3×10^{-16}	−17 ± 12	
AAAACA	29 (5)	0.5	8×10^{-12}	−20 ± 10	
GGGGCU	22 (3)	0.3	9×10^{-12}	−24 ± 13	



In contrast to human, PAS in Arab is highly degenerate. E.g., only 10% of Arab PAS is AAUAAA!

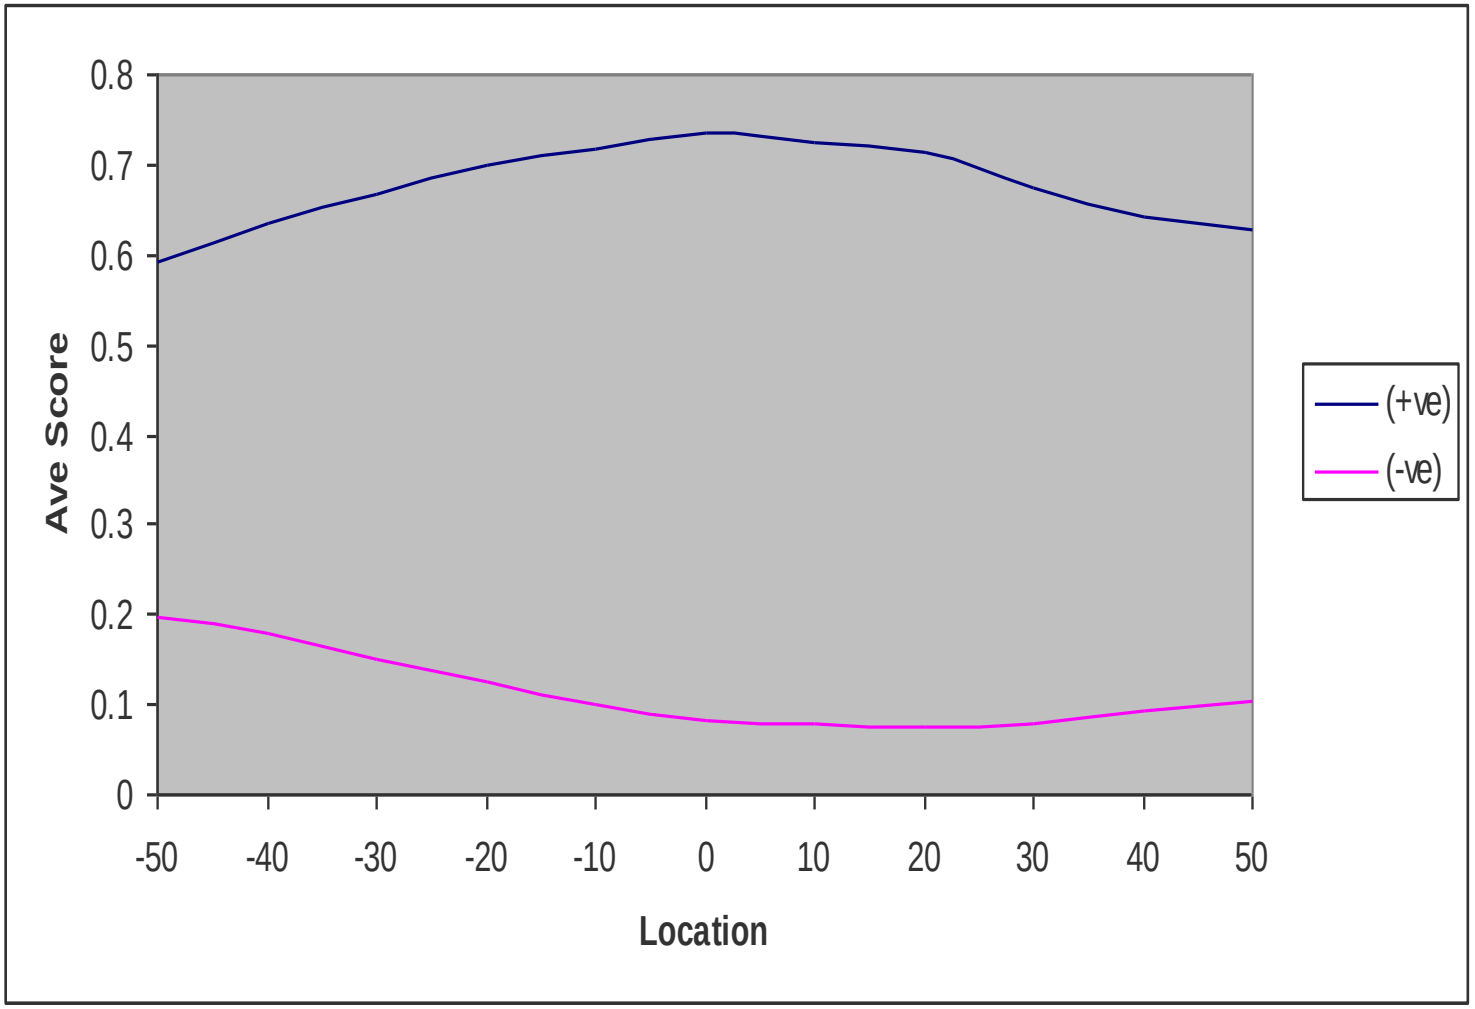
Approach on Arab PAS sites (I)



Approach on Arab PAS sites (II)

- **Data collection**
  - #1 from Hao Han, 811 +ve seq (-200/+200)
  - #2 from Hao Han, 9742 –ve seq (-200/+200)
  - #3 from Qingshun Li,
    - **6209 (+ve) seq (-300/+100)**
    - **1581 (-ve) intron (-300/+100)**
    - **1501 (-ve) coding (-300/+100)**
    - **864 (-ve) 5'utr (-300/+100)**
- **Feature generation**
  - 3-grams, compositional features (4U/1N. G/U*7, etc)
  - Freq of features above in 3 diff windows: (-110/+5), (-35/+15), (-50/+30)
- **Feature selection**
  - $\chi 2$
- **Feature integration & Cascade**
  - SVM

Score profile relative to candidate sites



NUS National University of Singapore

Validation results

SN_0	SMO 1		SMO 2		PASS 1.0	
Control Sequences	SN & SP	Threshold	SN & SP	Threshold	SN & SP	Threshold
CDS	90%	0.26	94%	0.24	95%	3.7
5'UTR	79%	0.42	85%	0.49	78%	5.5
Intron	64%	0.59	71%	0.67	63%	6.3

Table 2. Equal-error-rate points of SMO1, SMO2, and PASS 1.0 for SN_10.

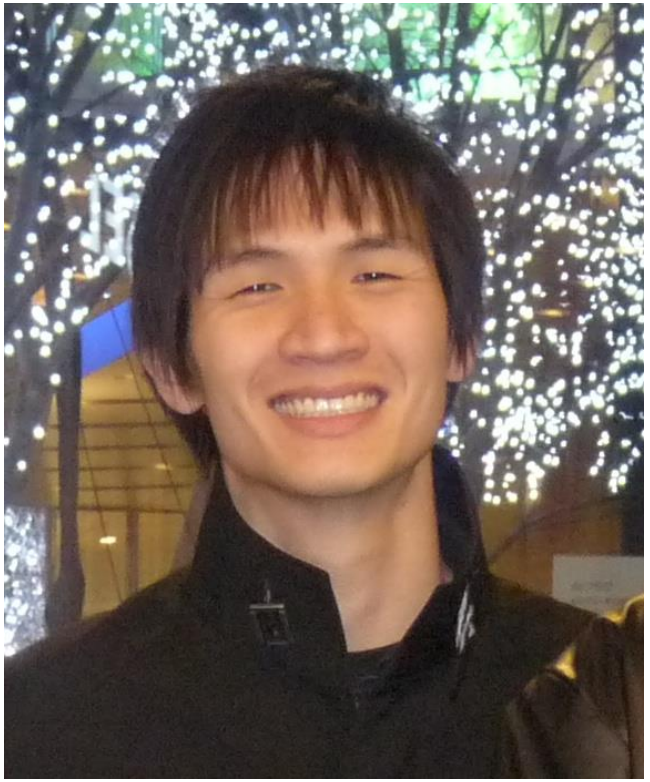
SN_10	SMO 1		SMO 2		PASS 1.0	
Control Sequences	SN & SP	Threshold	SN & SP	Threshold	SN & SP	Threshold
CDS	94%	0.36	96%	0.31	96%	4
5'UTR	86%	0.53	89%	0.6	81%	5.7
Intron	73%	0.68	77%	0.77	67%	6.6

Table 3. Equal-error-rate points of SMO1, SMO2, and PASS 1.0 for SN_30.

SN_30	SMO 1		SMO 2		PASS 1.0	
Control Sequences	SN & SP	Threshold	SN & SP	Threshold	SN & SP	Threshold
CDS	97%	0.44	97%	0.37	97%	4.3
5'UTR	90%	0.62	92%	0.67	84%	6.2
Intron	79%	0.75	83%	0.81	72%	6.8

About the inventor: Koh Chuan Hock

- **Koh Chuan Hock**
  - BComp (CB), NUS, 2008
  - PhD, NUS, 2012
  - Currently Data Scientist at Indeed Inc, Japan



Concluding Remarks…

NUS National University of Singapore

What have we learned?

- **Gene feature recognition applications**
  - TIS, TSS, PAS
- **General methodology**
  - "Feature generation, feature selection, feature integration"
- **Important tactics**
  - Multiple models to optimize overall performance
  - Feature transformation (DNA → amino acid)
  - Classifier cascades

Any Question?

Acknowledgements

- **The slides for PAS site prediction are adapted from slides given to me by Koh Chuan Hock**
