

# Theory, Practice, and an Application of Frequent Pattern Space Maintenance

**Limsoon Wong**

**(Joint work with Mengling Feng,  
Thanh-Son Ngo, Jinyan Li, Guimei Liu)**

# What Data?

Market Basket Dataset		Generic Dataset	
Tid	Transactions	Tid	Transactions
1	milk, bread, chips	1	a, b, c, d
2	beer, chips	2	b, d
3	beer	3	a, c, d
4	milk, bread	4	a, c
Patterns: {milk, bread} : 2		{a} : 3	
{beer} : 2		{a, b} : 1	
{milk, beer} : 0		{a, b, c, d} : 1	

- **Transactional data**
  - Items, transactions, transaction ID, pattern, support of pattern

# What Pattern?

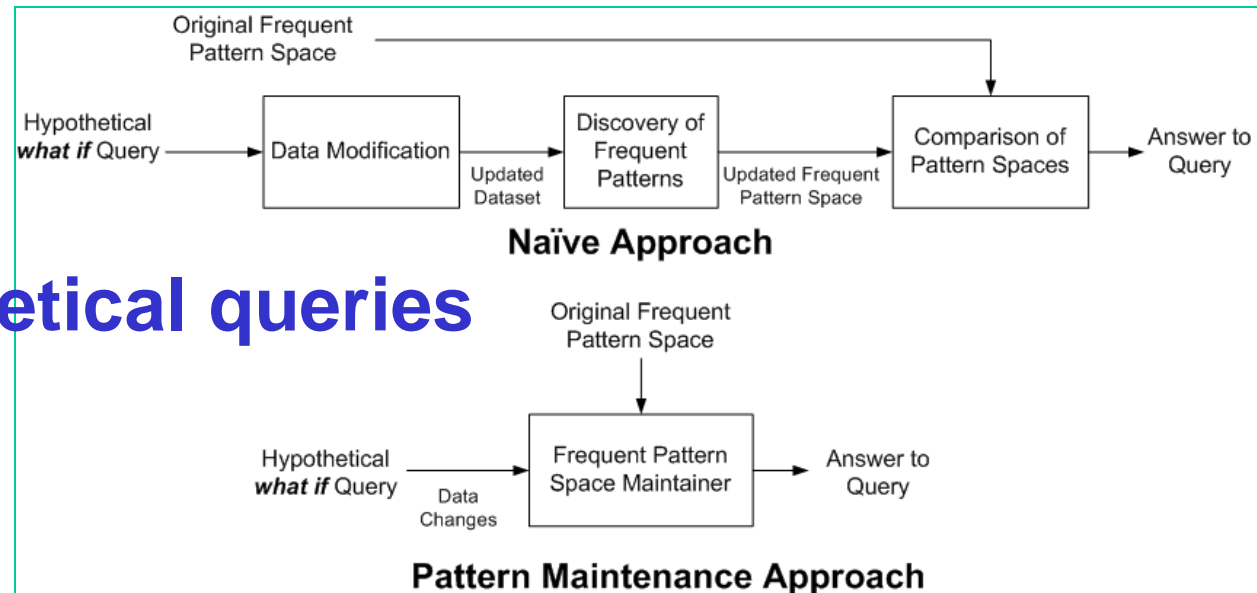

- **Freq patterns & space of freq patterns**
  - Minimum support threshold
  - $ms_a$  or  $ms_{\%}$  ( $ms_a = \text{ceil}(ms_{\%} \times |D|)$ )
  - Huge:  $2^n$  ( $2^{100} \approx 1.3 \text{ E } 30$ )

# What Updates?

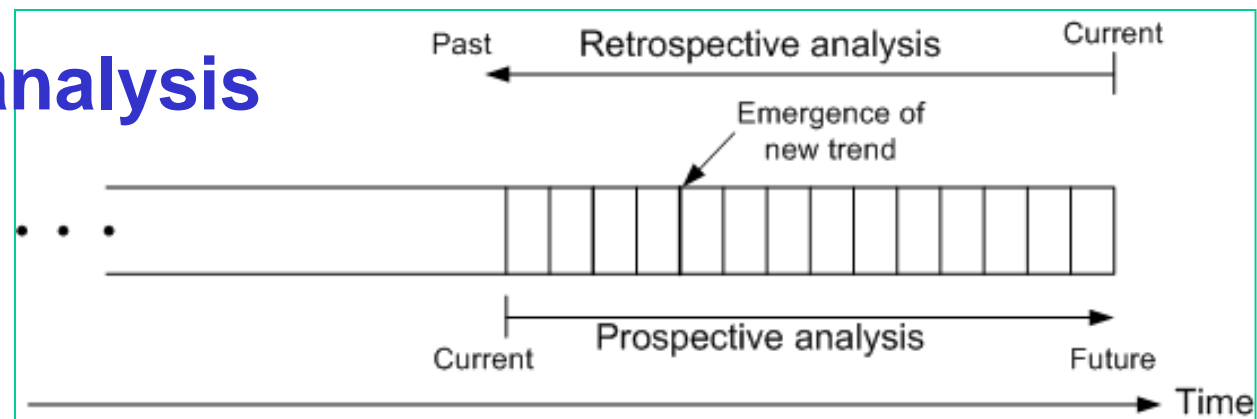

- **Incremental updates**
- **Decremental updates**
- **Support threshold adjustment**

# Motivation

- Hypothetical queries

- Trend analysis

# Challenges

- **# of existing freq patterns is large**
  - Naïve maintenance:  $O(\text{NFP} \times m)$ 
    - **NFP, # of freq patterns (upper bound  $2^n$ )**
    - **$m$ , # of updated transactions**
- **# of “new” freq pattern candidates is large**
  - $2^n - \text{NFP} (\approx 2^n)$
- **Existing approaches: Extension of certain pattern discovery algo / data structure they used**
- **What is missing?**
  - How freq pattern space evolves
  - A theoretical framework

# Outline

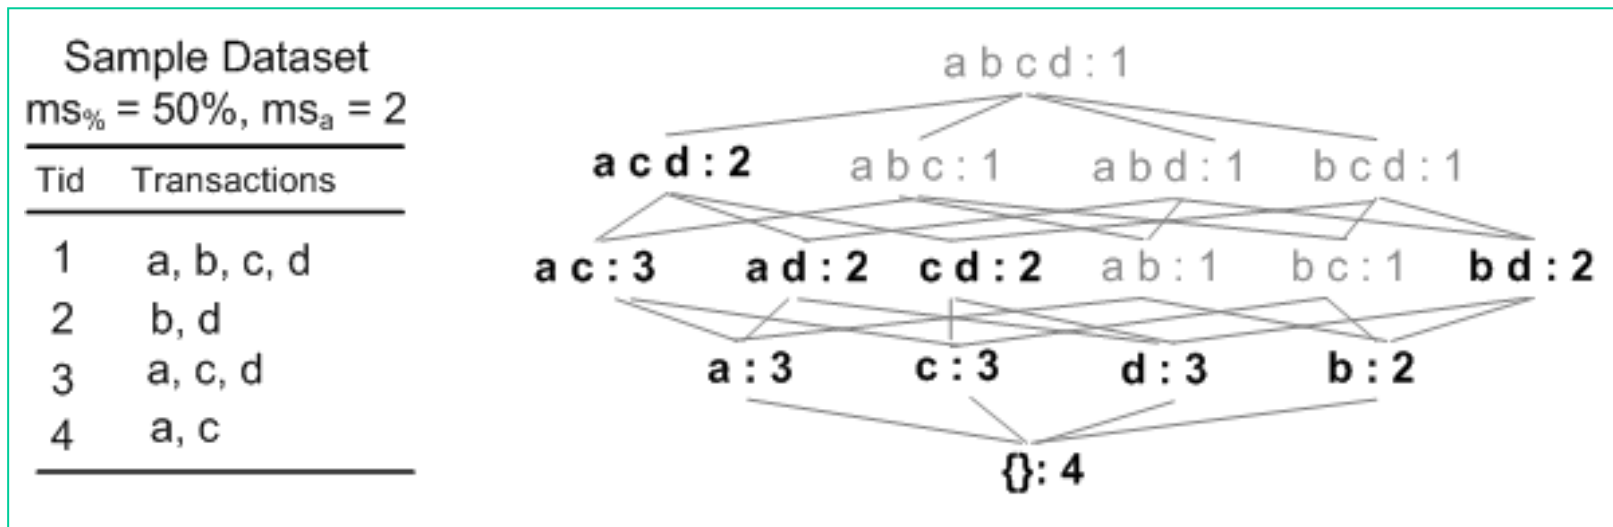

- **Pattern space evolution**
- **TRUM: A decremental maintainer**
- **PSM: A complete maintainer**
- **Optimizing performance of PCL Classifier**

# Pattern Space Evolution

# Basic Property of Pattern Space

- **Anti-monotone property**
  - If  $P$  is freq, all subset of  $P$  is freq
  - If  $P$  is infreq, all superset of  $P$  is infreq

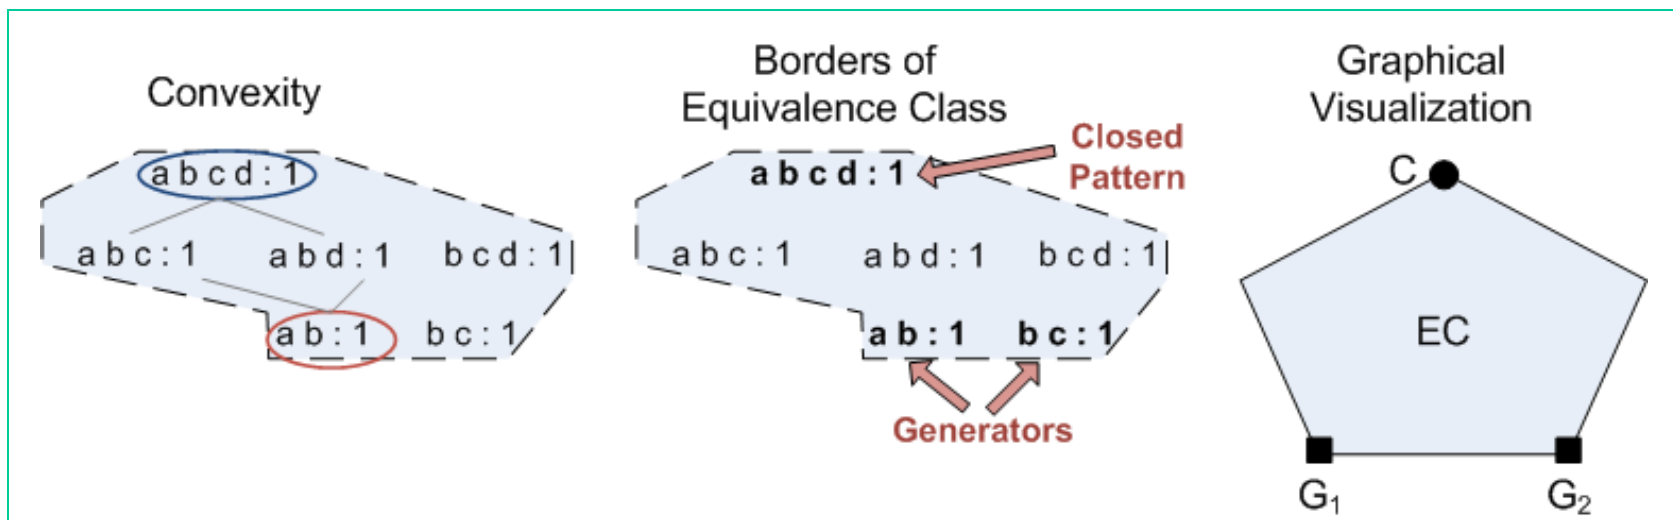

# Decomposition into Equiv Classes

- **Equiv Class: A set (class) of patterns that appear in exactly the same transactions**

# Equivalence Class

- **Equiv classes are convex**
- ⇒ **Can be compactly represented by borders**
  - A unique closed pattern (most specific pattern)
  - A set of generators (most general patterns)

# Pattern Space Evolution = Equiv Class Evolution

- **Pattern Space Maintenance  
= Equiv Class Maintenance**

- **Equiv Class Maintenance  
= Border Maintenance**

# Equiv Class Evolution

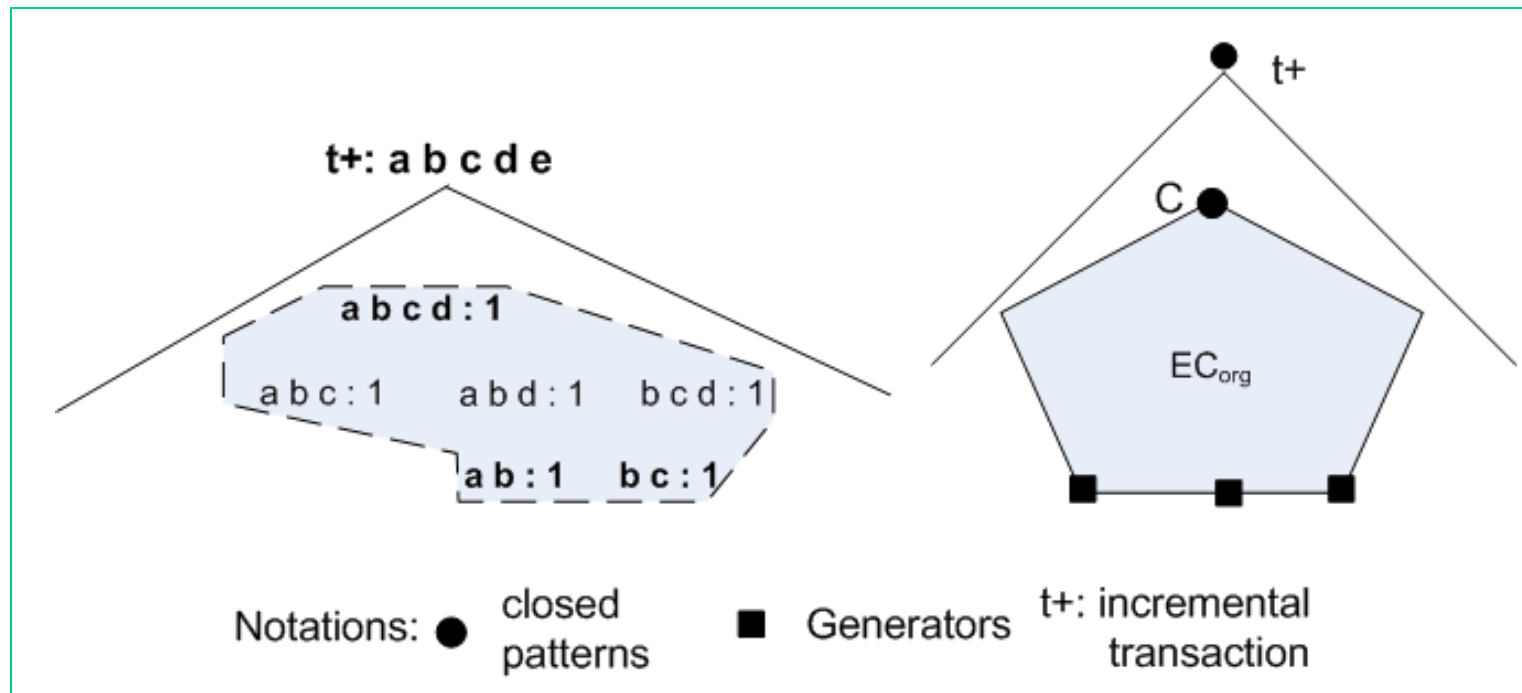

## Incremental Updates: Case 1

- No structural change and no change to support
- Condition:  $\forall G \notin t+$

# Equiv Class Evolution

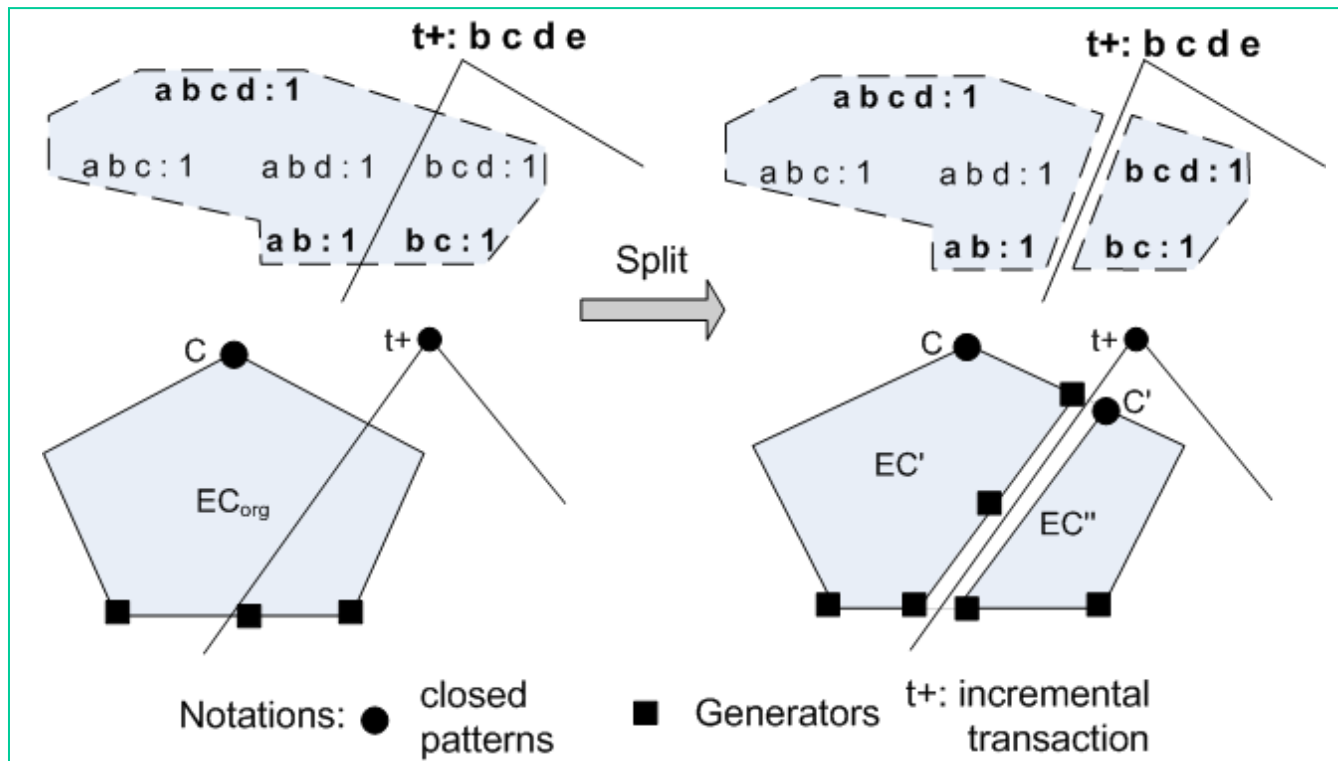

## Incremental Updates: Case 2

- Structurally unchanged but increased in support
- Condition:  $C \subseteq t+$

# Equiv Class Evolution

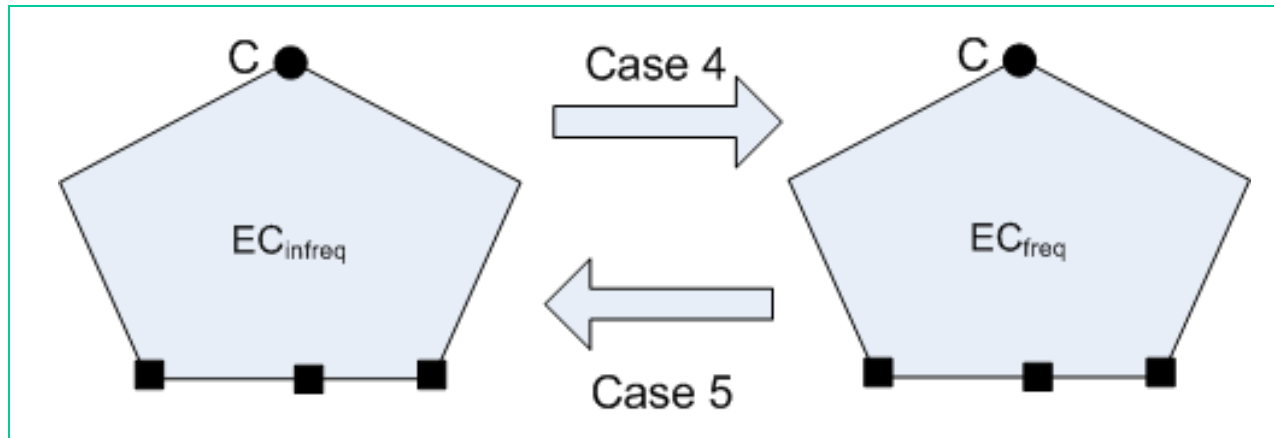

## Incremental Updates: Case 3

- Split into two
- Condition:  $C \not\subseteq t^+$ , but  $\exists G \subseteq t^+$

# Equiv Class Evolution

## Incremental Updates: Case 4 & 5

- **Case 4: Emerge to be NEW freq equiv class**
- **Case 5: Become infreq**
  - $ms_a = \text{ceil}(ms_{\%} \times |D|)$
  - $\therefore D_{inc} \rightarrow D \Rightarrow |D| \uparrow \Rightarrow (ms_{\%} \times |D|) \uparrow \Rightarrow ms_a \uparrow$

# Key Incremental Maintenance Tasks

- **Support update**
  - $O(N_{EC} \times m)$
- **Class splitting**
  - $O(N_{EC} \times m)$
- **New class discovery**
  - $O(2^n - N_{FP})$
- **Obsolete class removal**
  - $O(N_{EC})$

PSM+ does  
these tasks  
efficiently

# Equiv Class Evolution: Decremental Updates

- **Incremental**

- No change
- $\uparrow$  in support
- Split up
- Emerge as freq class due  $\uparrow$  in support
- Become infreq due to  $\uparrow$  in  $ms_a$

- **Decremental**

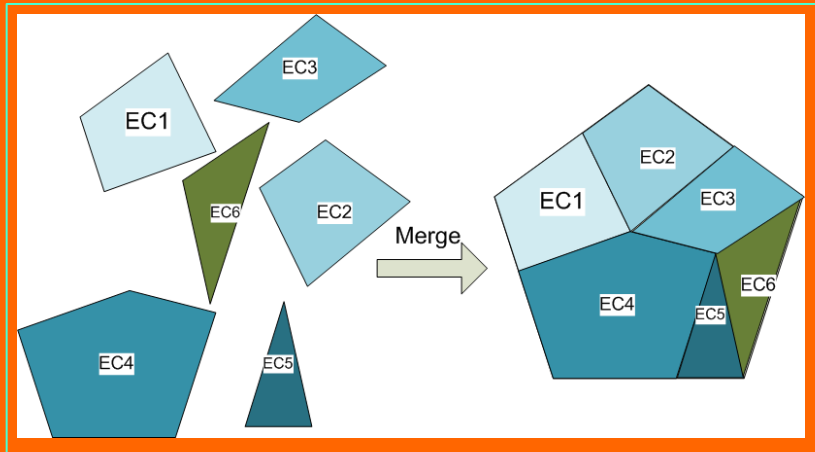

- No change
- $\downarrow$  in support
- Merge w/ other class
- Become infreq due to  $\downarrow$  in support
- Emerge to be freq class due to  $\downarrow$  in  $ms_a$

# Key Decremental Maintenance Tasks

- **Update support**
- **Merge Class**
- **Discover new freq class**
- **Remove obsolete class**

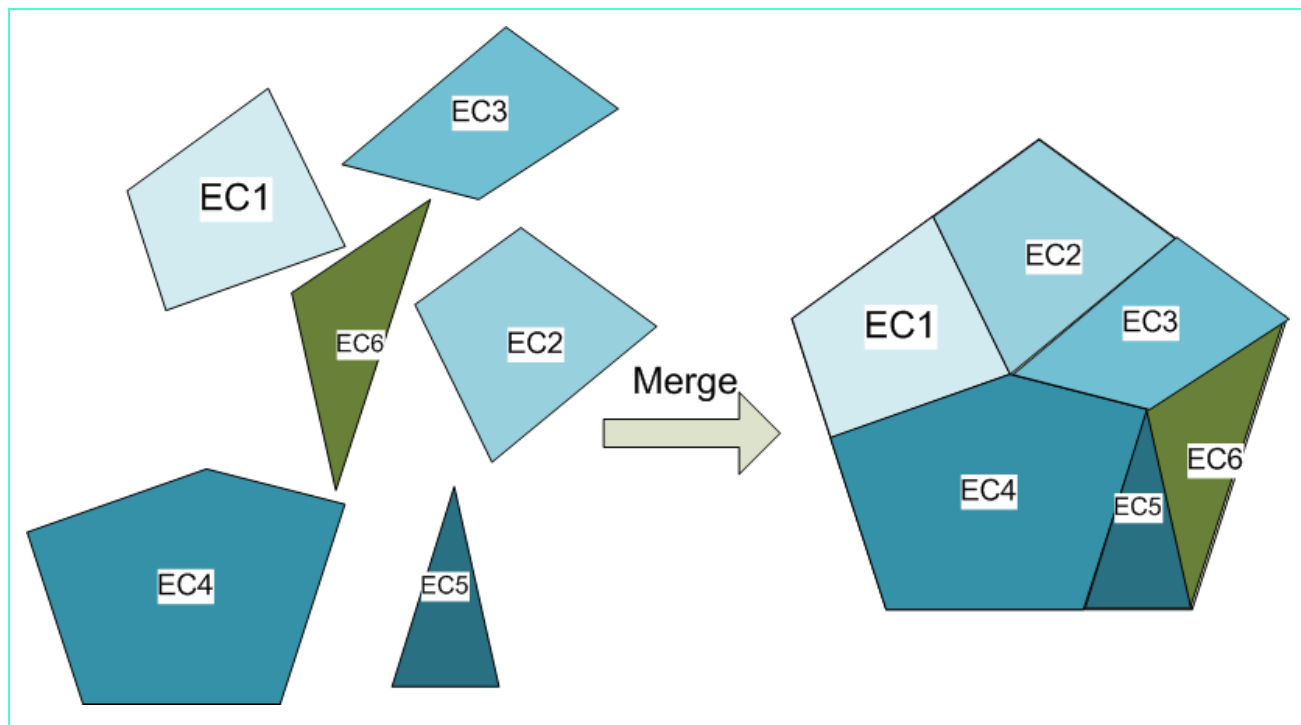

PSM– and  
TRUM do  
these tasks  
efficiently

# Transaction Removal Update Maintainer, TRUM

# TRUM

- A decremental maintainer
- Major challenge: Merging of classes

# Transaction ID-tree (Tid-tree)

Original Dataset  
( $ms_a = 2$ )

TID	Transactions
1	a, b, c, d
2	b, d
3	a, c, d
4	a, c
5	b

Discovery of  
Equivalence  
Classes

Frequent equivalence  
classes:

EC\_1: { {a}, {c}, {a, c} } : **1, 3, 4** (3)

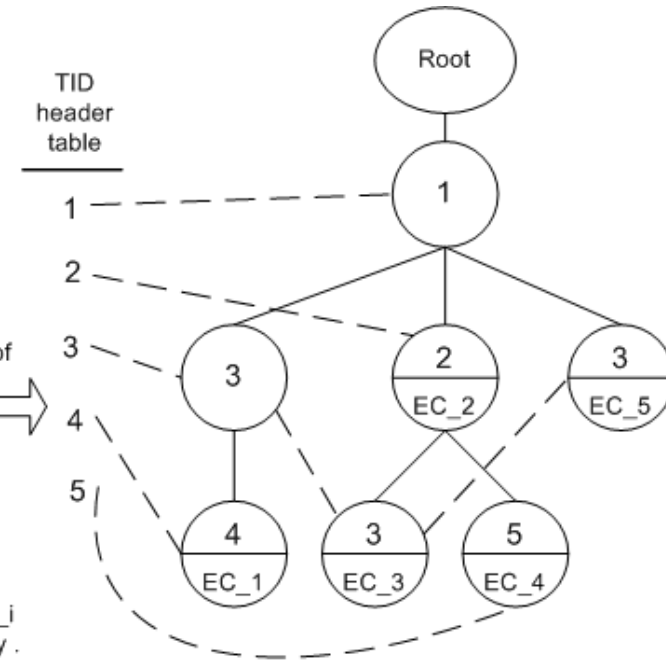

EC\_2: { {b, d} } : **1, 2** (2)

EC\_3: { {d} } : **1, 2, 3** (3)

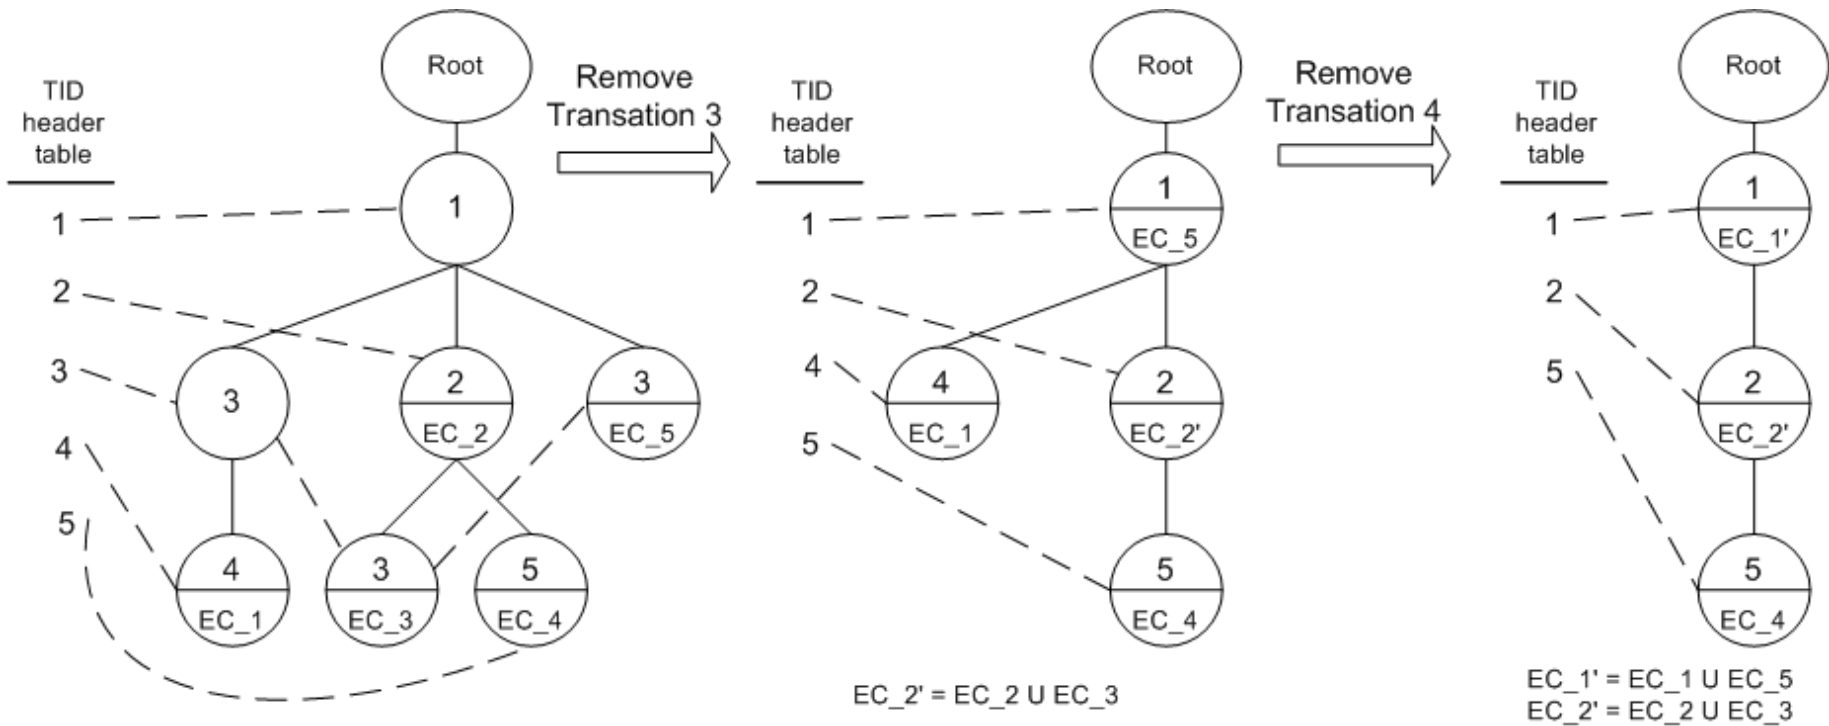

EC\_4: { {b} } : **1, 2, 5** (3)

EC\_5: { {a, d}, {c, d}, {a, c, d} } : **1, 3** (2)

Construction of  
TID-tree

Notation:  $EC_i: \{.\} : x (y)$  refers to an equivalence class  $EC_i$ , where  $EC_i$  consists patterns  $\{.\}$ , the TID-list of  $EC_i$  is  $x$ , and the support of  $EC_i$  is  $y$ .

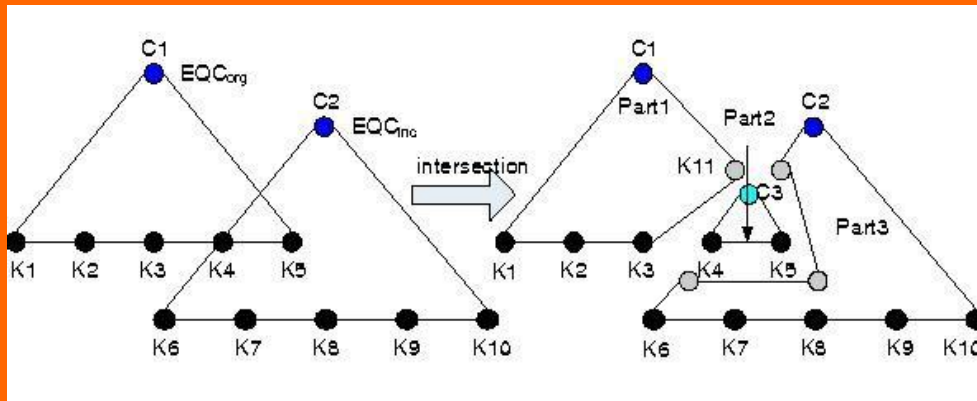

## Fast Decremental Maintenance on Tid-tree

## Performance: Speed Up

Dataset	Discovery Algorithms		Maintenance Algorithms		
	FP-growth*	GC-growth	Borders	ZIGZAG	moment
chess $ms_a = 1.5k$	130	13	1,980	28	10,600
connect $ms_a = 30k$	24	1.5	2,400	10	182
mushroom $ms_a = 500$	1,240	31	6,500	486	10,700
retail $ms_a = 100$	58	306	48	818	208
t10i4d100k $ms_a = 500$	64	113	66	90	1,288
average	<b>119</b>	<b>80</b>	<b>2,268</b>	<b>174</b>	<b>2,848</b>

# Pattern Space Maintainer, PSM

# PSM: A Complete Maintainer

- **Incremental: PSM+**
- **Decremental: PSM-**
- **Threshold adjustment: PSM $\Delta$**

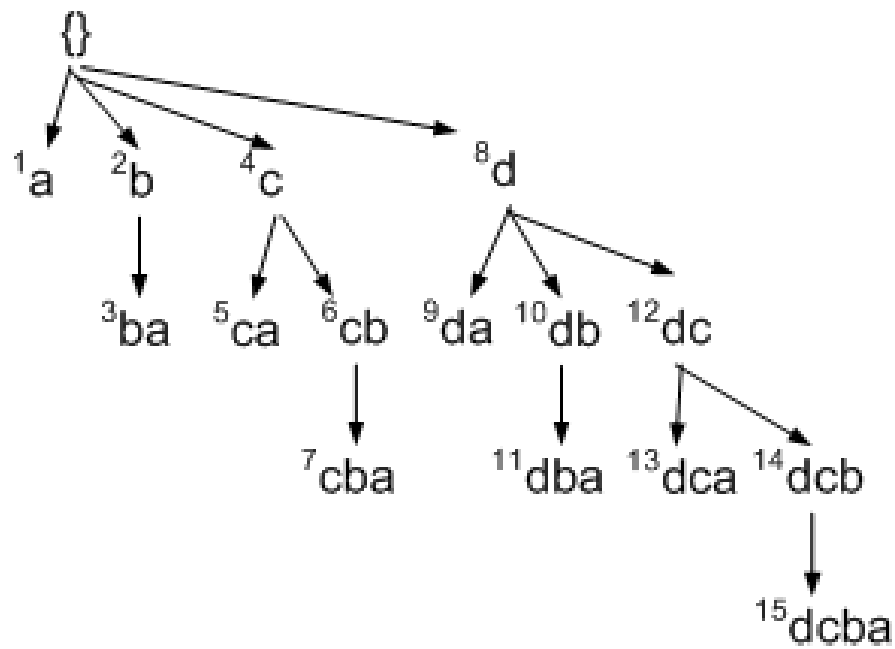

# PSM+

- **Key idea**
  - Only update those who need to be updated
  - $O(N_{\text{affectedEC}})$
- **Solution**
  - Generator Enumeration tree (GE-tree)

- **Key tasks**

- Support update
- Class splitting
- New class discovery
- Obsolete class removal

# Set-Enumeration Tree

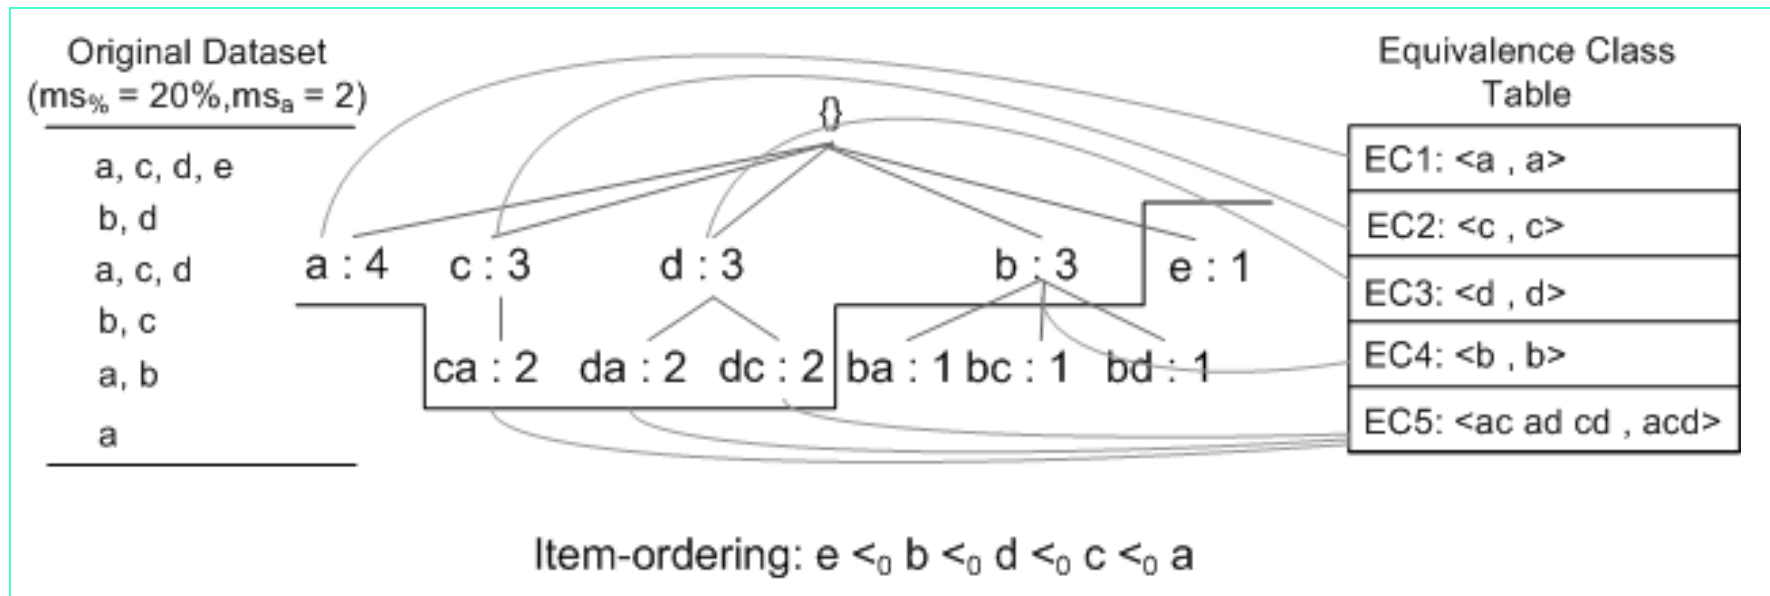

Item-ordering:  $d <_0 c <_0 b <_0 a$

Item-ordering:  $d <_0 c <_0 b <_0 a$

# Generator-Enumeration Tree

- **Key features**
  - Generators only
  - Link to corresponding equiv class
  - Negative border generators

# Update of GE-tree

Original Dataset  
 ( $ms_{\%} = 20\%, ms_a = 2$ )

a, c, d, e  
 b, d  
 a, c, d  
 b, c  
 a, b  
 a

Frequent Equivalence  
 Class Table

EC1: <a , a>: 4
EC2: <c , c>:3
EC3: <d , d>:3
EC4: <b , b>:3
EC5: <ca da dc , dca>:2

Item-ordering:  $e <_0 b <_0 d <_0 c <_0 a$

Insert  $t^+ : \{b,c,d\}$

Updated Dataset  
 ( $ms_{\%} = 20\%, ms_a = 2$ )

a, c, d, e  
 b, d  
 a, c, d  
 b, c  
 a, b  
 a  
 b,c,d

Frequent Equivalence  
 Class Table

# Conclusions

- Analysis of evolution of freq pattern space
- TRUM, efficient decremental maintenance
- PSM, efficient complete maintenance

# Efficiently Finding Best Parameter for Rule-Based Classifier PCL

# Emerging Patterns

- **Freq patterns: Set of items appearing in many records in the dataset**
- **Jumping emerging patterns (JEP): Patterns freq in one class but absent in other classes**
- **JEPs capture characteristics of the class that distinguish them from other classes**
- **App in classification: JEPs are used to make predictions**

# Assoc Rule-Based Classification

- **A set of rules is constructed from data**
- **Class labels of test instances are determined by these rules**
  
- **3 main types of rule-based classifiers**
  - Best pattern is used to make prediction
  - **A set of patterns is used to make prediction**
  - A set of patterns is used as the best features and then a normal classifier is then trained on these features

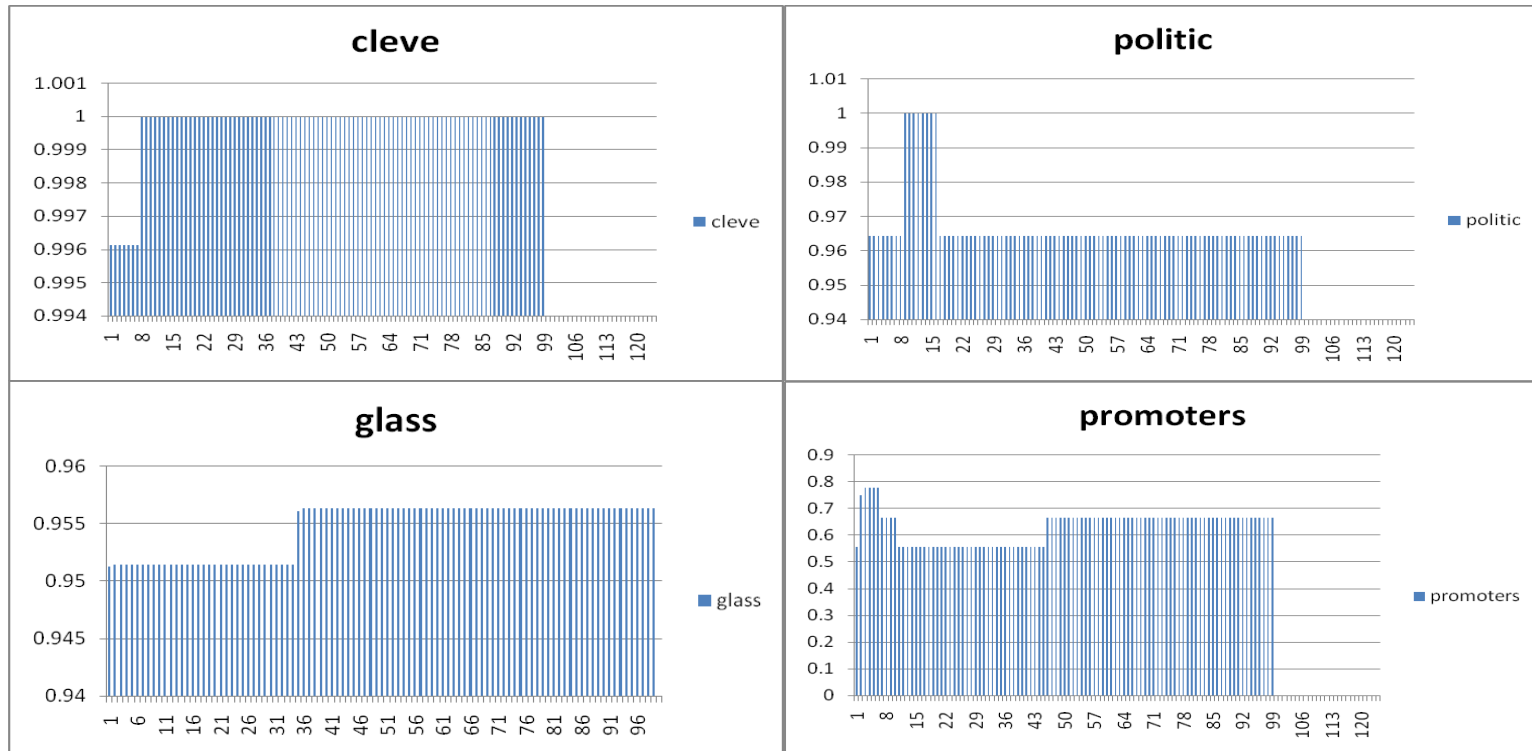

# PCL

- **Construct rules from JEPs**
- **Given training set, collect JEPs for each class**
- **Given test instance, score for each class is sum of support of top K JEPs that cover the test instance divided by the sum of support of top K JEPs in this class**

$$Score(t,+) = \frac{\sum_{i=1}^k \text{sup}(EP_{t_i}^+, D)}{\sum_{i=1}^k \text{sup}(EP_i^+, D)} \quad Score(t,-) = \frac{\sum_{i=1}^k \text{sup}(EP_{t_i}^-, D)}{\sum_{i=1}^k \text{sup}(EP_i^-, D)}$$

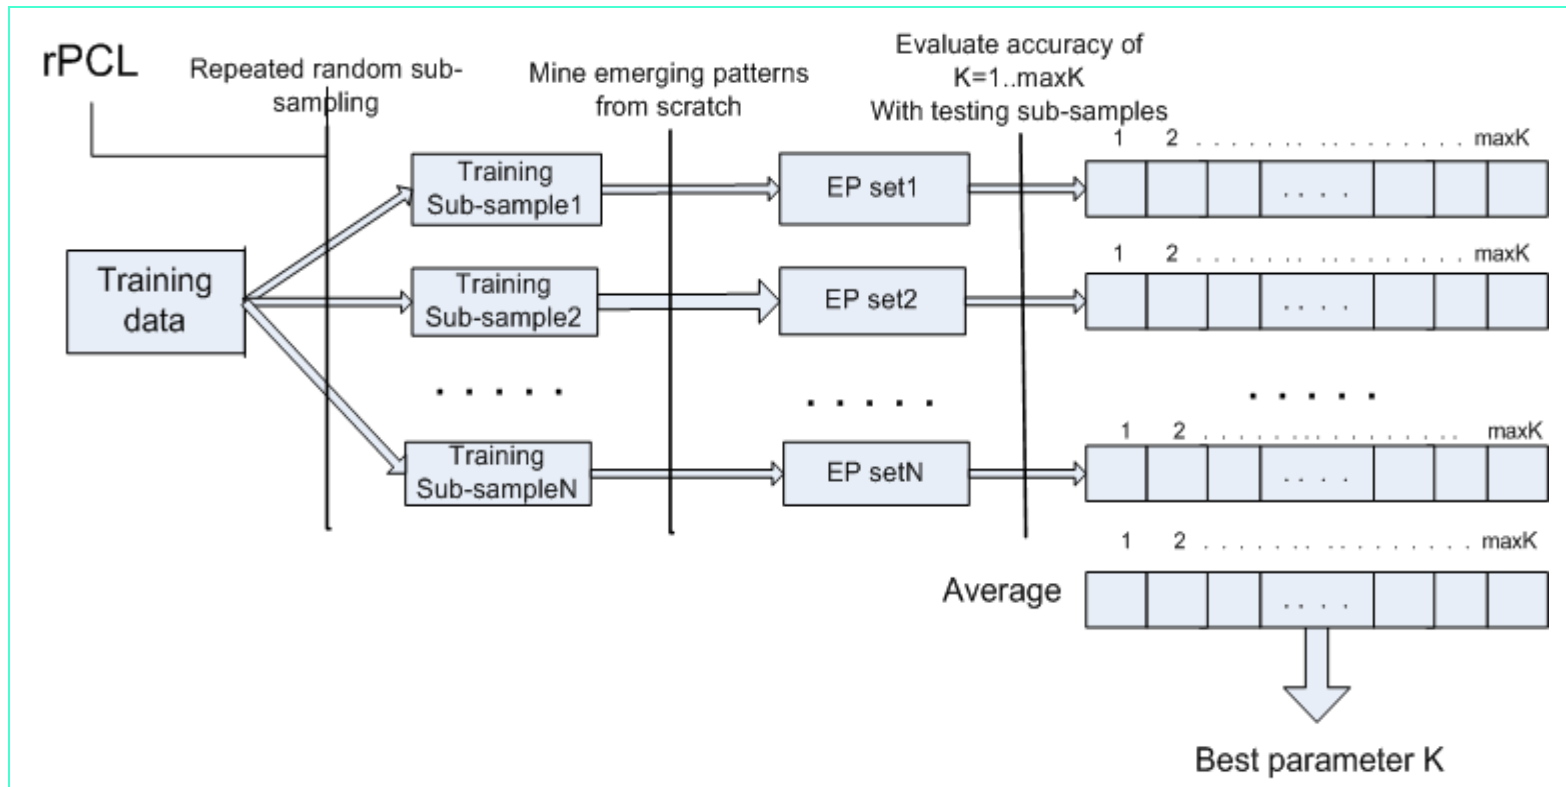

- **Class whose score is higher wins**
  - Value of K affects prediction results

# Value of K Affects Prediction

- **K too small: Lose power of small-support JEPs**
  - **K too big: Suffer over-fitting from too many JEPs**
- ⇒ **How to choose K ?**

# rPCL: Optimize Parameter by CLT

- Simulate proc of classification in a training set on each  $K$
- Select  $K$  that gives best estimated performance
- Correctness is guaranteed by CLT

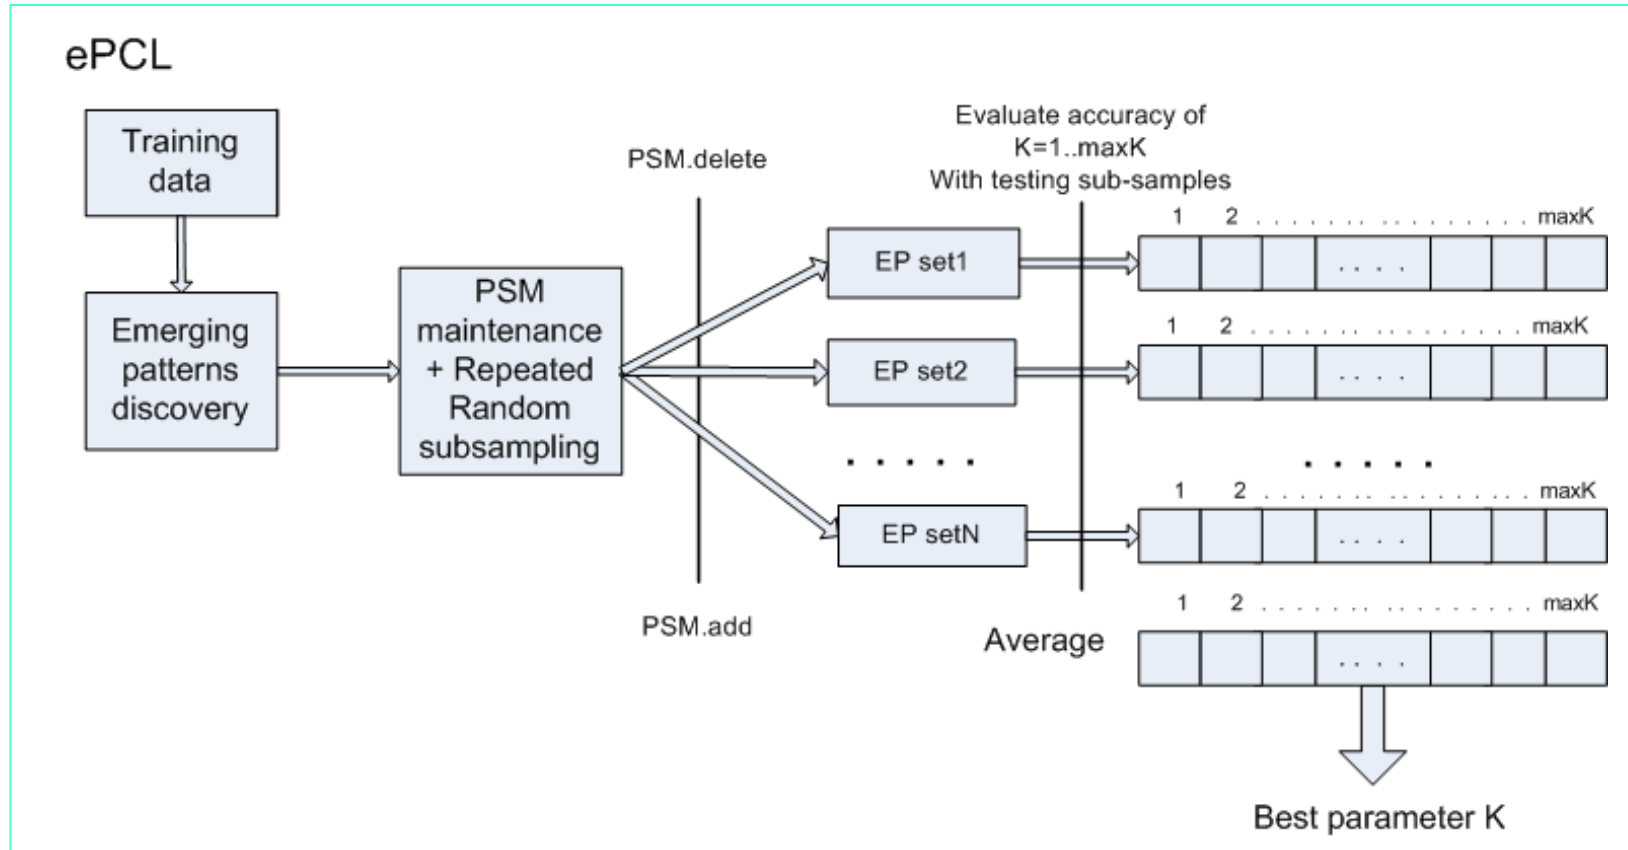

# Pattern Space Maintenance

- **Pattern space is set of freq patterns in a data set**
- **Small change in data set unlikely to cause big change in pattern space**

	Original	After removal
Dataset	abc abd ade ade	abd ade ade
Frequent patterns	a, b, d, e, ab, ad, ae, de ade	a, d, e, ad, ae, de, ade

- **Pattern space maintained efficiently by PSM algo**

# ePCL: Use PSM to improve rPCL

- **Maintain freq JEPs using PSM**
- ⇒ **PCL can be constructed fast from one sampling to others**

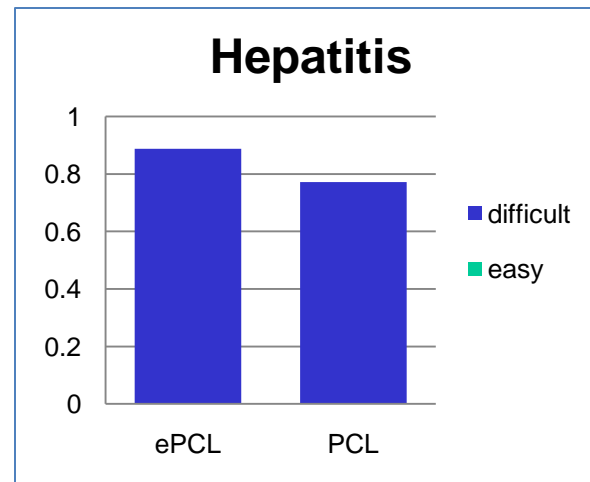

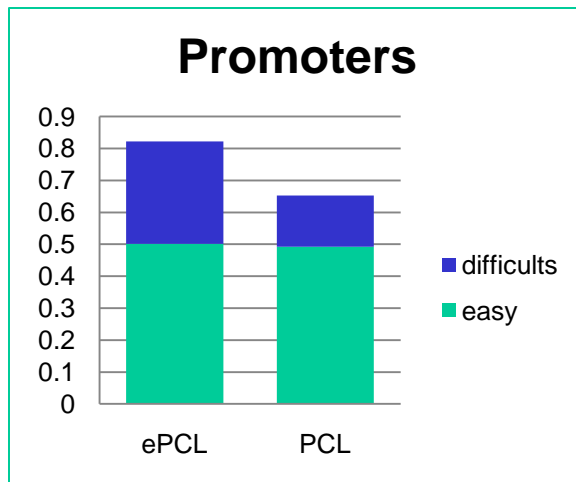

## Accuracy Improved in Most Cases

	ePCL	PCL	Improvement (%)
Promoters	0.82	0.65	25.92
Hepatitis	0.89	0.77	14.98
Wine	0.98	0.88	11.39

- E.g., promoters, hepatitis, & wine datasets improved by 26% , 15%, & 11% respectively

# Difficult Cases

- Improvement in difficult cases is more significant. Difficult cases are cases when scores for both classes are non-zero

# Efficiency

- ePCL & rPCL same results but ePCL is lots faster
- ePCL slower than PCL due to repeated sampling

Datasets	PCL	rPCL	ePCL	Speed up (rPCL/ePCL)
Iris	2.0	99.0	3.0	33.0
zoo	5.0	291.0	7.0	41.5
splice	2.5	129.0	4.0	32.2
hepatitis	0.5	38.0	3.0	12.6

Running time for 10 folds cross-validation (in seconds)

# Conclusions

- **Good choice of  $K$  for PCL is important**
- **We introduce ePCL to choose optimal  $K$** 
  - ePCL uses pattern maintenance for efficiency
  - ePCL uses sub-sampling and CLT to choose  $K$
- **Our technique improves PCL's accuracy and running time**
  - Especially in difficult cases !
